MaxiTurn – Base holders for the exchangeable head system – Actively vibration-damped – MaxiChange

▲ Reduction in vibrations due to actively mounted dampers
▲ Improved surface quality and chip removal

Scope of supply:
Includes clamping screws

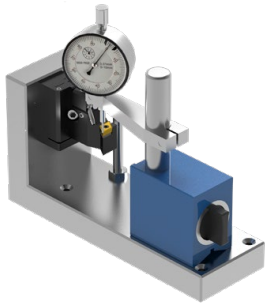
Adjustment device for setting height of tool block holder

- Reduced setup times thanks to convenient presetting away from the machine
- Prevention of machine downtimes
- Best positional accuracy following tool change by presetting away from the machine

Scope of supply:
72 996 05001: Adjustment device with dial gage and dial gage stand
72 996 05002: Adjustment device without dial gage and dial gage stand



Designation	AS 72 996 ...
MU.EV MAX	05001
MU.EV MAX-OMU	05002

Information on correct application and any conversions required can be found in the technical appendix.

The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material, and type of machine. The specified values represent guideline cutting data that can be adjusted by approx. **±20%** according to the usage conditions.

You will find information here on the cutting data ranges for chip breakers that are not listed in this overview.

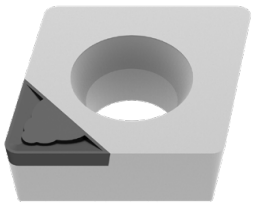
Cutting data standard values for CB chip breaker geometries

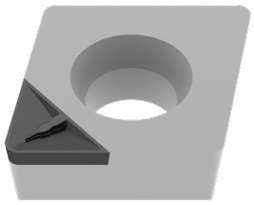
-CB1



3D chip breaker geometries -CB1				
Cutting radius	a_p in mm		f_z mm/rev.	
	min.	max.	min.	max.
0,1 mm	0,05	0,30	0,02	0,05
0,2 mm	0,06	0,40	0,03	0,08
0,4 mm	0,10	0,80	0,04	0,15
0,8 mm	0,15	1,00	0,08	0,20
1,2 mm	0,30	1,50	0,12	0,25

- ▲ Finish and super finish
- ▲ Extremely sharp cutting edge geometry
- ▲ Cutting depth a_p: 0.05–1.5 mm
- ▲ Lowest cutting pressure for highest precision
- ▲ For machining thin-walled and unstable workpieces

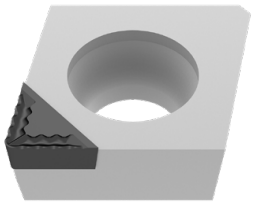
-CB2



3D chip breaker geometries -CB2				
Cutting radius	a_p in mm		f_z mm/rev.	
	min.	max.	min.	max.
0,2 mm	0,50	0,80	0,08	0,12
0,4 mm	0,60	1,50	0,08	0,20
0,8 mm	0,70	1,50	0,15	0,30
1,2 mm	0,80	2,00	0,20	0,40

- ▲ Semi-finish and finish machining
- ▲ Slightly negative cutting edge geometry
- ▲ Cutting depth a_p: 0.5–2.0 mm
- ▲ High surface quality with the tightest tolerances
- ▲ For machining solid workpieces and under stable conditions

-CB3



3D chip breaker geometries -CB3				
Cutting radius	a_p in mm		f_z mm/rev.	
	min.	max.	min.	max.
0,4 mm	1,00	3,00	0,10	0,20
0,8 mm	1,00	3,00	0,15	0,35

- ▲ Medium and rough machining
- ▲ Highly aggressive chip breaker
- ▲ Cutting depth a_p: 1.0–3.0 mm
- ▲ Stable component conditions necessary
- ▲ Cooling must be ensured

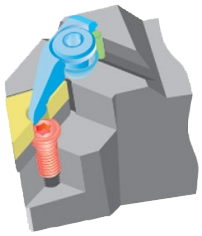
Clamping systems

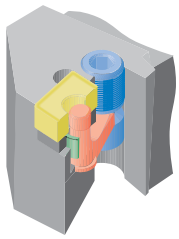
MaxiLock D



- Clamping element
- Indexable insert
- Insert seat
- Pin
- Screw

The first-choice tool for machining with negative center-hole inserts. Secure and precise positioning of the indexable insert thanks to the double clamping effect of the clamping element.

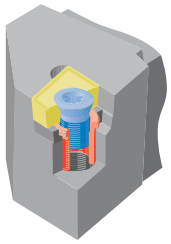
MaxiLock N



- Clamping element
- Indexable insert
- Insert seat
- Shim
- Lever

This clamping system is suitable for all center-hole inserts with a negative basic shape. The clamping screw is easy to access from the top and bottom of the holder. When the clamping system is released, there are no loose spare parts.

MaxiLock S

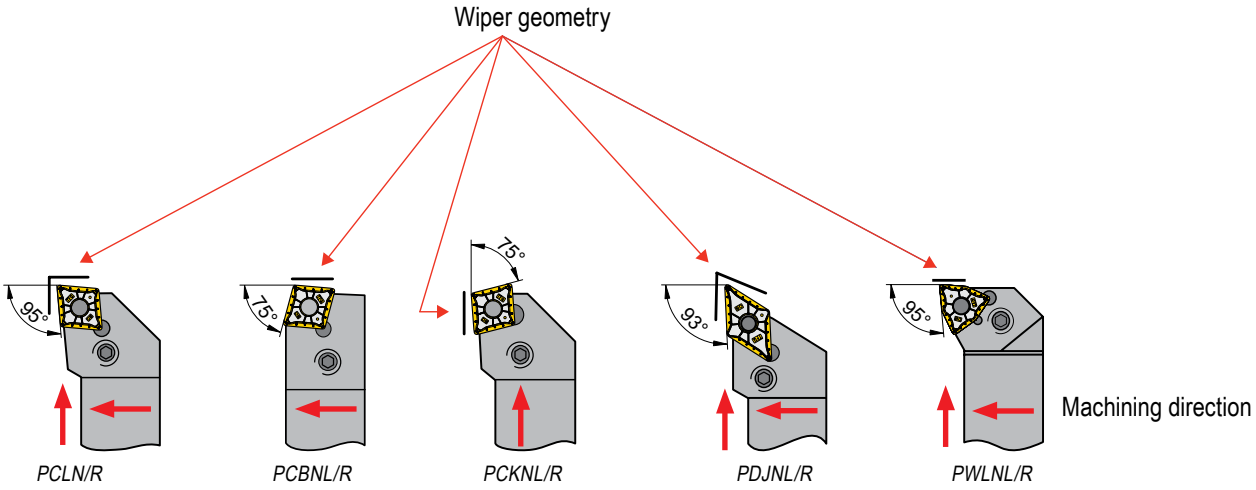


- Clamping element
- Indexable insert
- Insert seat
- Threaded bush

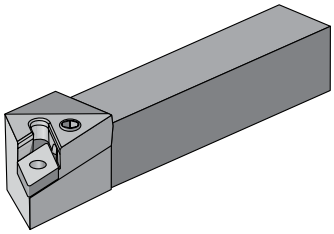
The positive screw clamping guarantees a secure connection between the indexable insert and the tool holder. The chip flow is not disrupted by protruding clamping elements. Thanks to the neutral insert position, the effective available rake angle is identical to the rake angle of the indexable insert.

Wiper geometry – Notes

High-quality surfaces can be produced using indexable inserts with wiper geometry (-TFQ; -TMQ; -SMQ; -25Q).

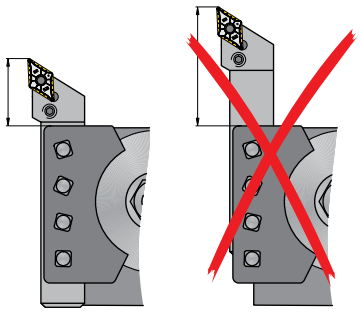


All turning inserts with wiper geometry are clamped in standard ISO tool holders

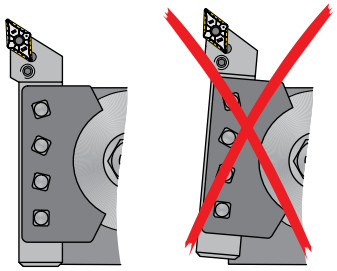


Check tool holder:

- ▲ Insert seat
- ▲ Shim
- ▲ Clamping lever



Short tool overhang



Ensure correct tool alignment

Feed rate guide values for surface quality

*Please ensure that the feed rate values used do not exceed the corner radius (RE).

Wiper geometry – How it works

Relationship of feed rate to surface roughness

Improved surface quality

Given identical feed rates, the indexable insert with wiper geometry attains an R_t value that is many times better than a conventional indexable insert.

Shorter machining time

If the same R_t value is achieved as with a standard indexable insert, the indexable insert with the wiper geometry can be moved at twice the feed speed **(= lower cycle times!)**

Theoretical surface quality

The maximum theoretical surface roughness with turning $Rt_{theor.}$ is the combination of feed rate and corner radius:

$$Rt_{theor.} = \left(r_\varepsilon - \sqrt{r_\varepsilon^2 - \frac{f^2}{4}}\right) \cdot 1000$$

Or approximately:

$$Rt_{theor.} = \frac{125 \cdot f^2}{r\varepsilon} \quad [\mu m]$$

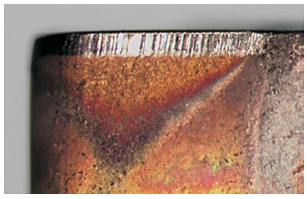
Types of wear

Flank wear



Abrasion on the flank: normal wear after a certain period of operation.

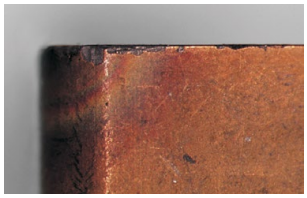
Cause

- Cutting speed too high
- Carbide grade does not have enough wear resistance
- Feed not adapted to application

Solution

- Reduce cutting speed
- Select a carbide grade with high wear resistance
- Bring feed into the right relationship with cutting speed and cutting depth

Chipping



Increased mechanical stress on the cutting edge may result in carbide particles breaking off.

Cause

- Grade with too high a wear resistance
- Vibrations
- Feed or cutting depth is too high
- Interrupted cut
- Chip stroke

Solution

- Use tougher grade
- Use negative cutting edge geometry with a chip breaker
- Improve stability (tool, workpiece)

Crater wear

The outgoing hot chip is causing cratering of the cutting insert on the clamping flat.

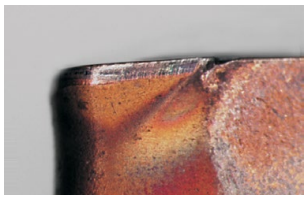
Cause

- Cutting speed, feed, or both are too high
- Rake angle too low
- Grade does not have enough wear resistance
- Insufficient coolant supply

Solution

- Reduce cutting speed and/or feed
- Choose carbide grade with greater wear resistance
- Increase quantity and/or pressure of coolant, check supply
- Use more crater-resistant grade

Plastic deformation



High machining temperature with simultaneous mechanical stress can lead to plastic deformation.

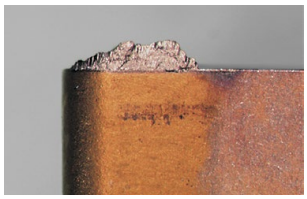
Cause

- Working temperature too high resulting in softening of the base material
- Damage to the coating
- Grade does not have enough wear resistance
- Insufficient coolant supply

Solution

- Reduce cutting speed
- Choose carbide grade with greater wear resistance
- Make provisions for cooling

Built-up edge formation



Material builds up on the cutting edge if the chip does not flow correctly due to the cutting temperature being too low.

Cause

- Cutting speed too low
- Rake angle too small
- Incorrect cutting material
- Lack of cooling/lubrication

Solution

- Increase cutting speed
- Increase rake angle
- Use TiN coating
- Use thicker emulsion

Edge breakage

If a cutting insert is overloaded, insert breakage may occur.

Cause

- Overload of the cutting material
- Lack of stability
- Wedge angle too small

Solution

- Use a tougher cutting material
- Use chamfer for edge protection
- Increase rounding of cutting edge
- Use more stable geometry

Grade description

Grades		ISO application range	Grade description Specification / Application recommendation
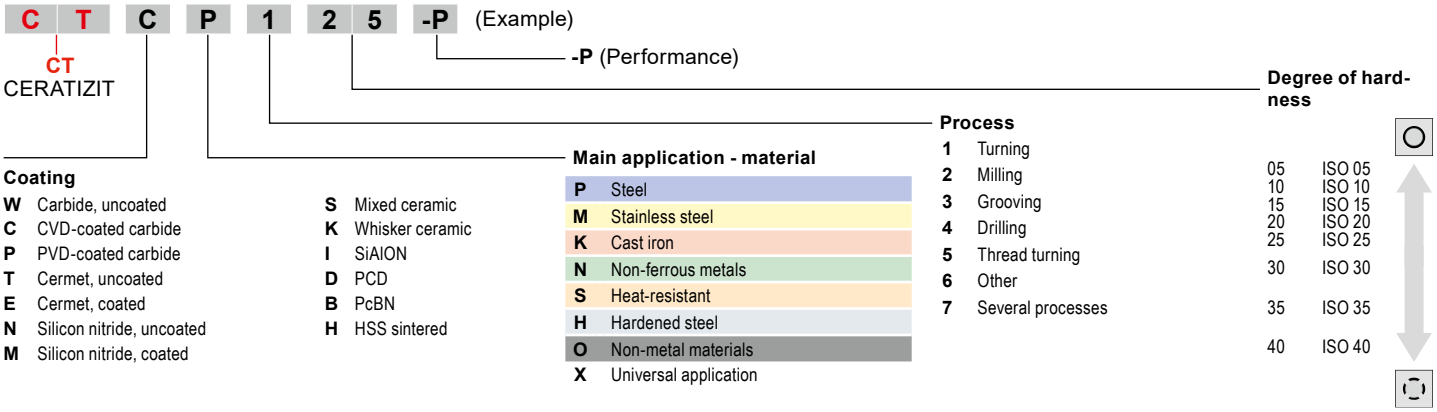
Main application ● Secondary application ○		V_c+ Wear-resistant — V_c− Tough 01 05 10 15 20 25 30 35 40 45 50	
CTCM120 DRAGONSKIN 	P ○ M ● K N S H O		**Specification:** Composition: Co 7%, mixed carbides 6%, WC balance | Grain size: 1-2 µm grain size | Hardness: HV_{30} 1500 | Layer system: CVD TiCN-Al_2O_3 **Usage recommendation:** Wear-resistant carbide grade for austenitic, stainless steel with the best levels of performance with a smooth cut.
CTPM125 DRAGONSKIN 	P ○ M ● K N S H O		**Specification:** Composition: Co 9.6%; mixed carbides 7.8%; others 0.4%; WC balance | Grain size: 1-2 µm | Hardness: HV_{30} 1460 | Coating specification: PVD TiAlTaN **Recommended application:** The first choice for the machining of austenitic steels
CTCM130 DRAGONSKIN 	P ○ M ● K N S ○ H O		**Specification:** Composition: Co 9.6%, mixed carbides 7.8%, WC balance | Grain size: 1-2 µm grain size | Hardness: HV_{30} 1460 | Layer system: CVD TiCN-Al_2O_3 **Usage recommendation:** Tough turning grade for austenitic, stainless steel with interrupted cutting conditions.
H210T 	P M K ○ N ● S ○ H O ○		**Specification:** Composition: Co 6.0%; WC balance | Grain size: 0.8 µm | Hardness: HV_{30} 1850 **Application recommendation:** The wear-resistant, uncoated carbide grade for machining aluminum and other non-ferrous metals.
H10T 	P M K ○ N ● S H O ○		**Specification:** Composition: Co 6.0%; WC balance | Grain size: 1 µm | Hardness: HV_{30} 1630 **Recommended application:** The uncoated carbide grade for the machining of aluminium and other non-ferrous metals
H216T 	P M K ○ N ● S H O ○		**Specification:** Composition: Co 6.0%; WC balance | Grain size: 1 µm | Hardness: HV_{30} 1630 **Recommended application:** The uncoated carbide grade for the machining of aluminium and other non-ferrous metals
CTPX710 DRAGONSKIN 	P ● M ● K N ● S ● H O		**Specification:** Composition: Co 6.0%; WC balance | Grain size: 0.8 µm | Hardness: HV_{30}1820 | Layer system: PVD AlTiN **Usage recommendation:** The universal carbide grade for the most demanding machining requirements for multiple materials.
CTPX715 DRAGONSKIN 	P ● M ● K ○ N ● S ● H O ○		**Specification:** Composition: Co 6.0%; WC balance | Grain size: 1 µm | Hardness: HV_{30}1650 | Layer system: PVD AlTiN **Usage recommendation:** The universal carbide grade for the most demanding machining requirements for multiple materials.
		01 05 10 15 20 25 30 35 40 45 50	

Designation key



Diamond as a cutting material

Ensures

- Optimal surface quality
- Burr-free workpieces
- Long tool life
- Lowest cutting forces
- High process security

Complete program of roughing, finishing, and wiper inserts for machining aluminum, non-ferrous metals, plastics, ...

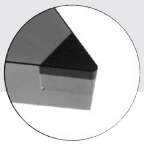
The cutting materials

	CTD CD10 (CVD)	CTD PD20 (PKD)	CTD PU20 (PKD)	CTD PS30 (PKD)
	Fine grain grade (N10)	Fine grain grade (N20)	Coarse grain grade (N20)	Coarse grain grade (N30)
Characteristics	▲ Optimum sharpness of the cutting edges ▲ No cutting pressure ▲ Very tight tolerances ▲ Maximum wear resistance with increased toughness ▲ Very high thermal conductivity	▲ Good cutting edge sharpness ▲ Lower cutting pressure than with PDC-S ▲ Tight tolerances ▲ Low wear resistance with increased toughness	▲ Good cutting edge sharpness ▲ Reduced cutting pressure ▲ Tight tolerances ▲ Very high level of wear resistance and toughness	▲ Good cutting edge sharpness ▲ Reduced cutting pressure ▲ Tight tolerances ▲ Lower wear resistance than with PDC, with increased toughness
Material	Suitable for super-finishing to semi-finishing all non-ferrous metals and non-ferrous composite materials with low to high proportions of abrasive fillers	Suitable for fine finishing and finishing all non-ferrous materials with low proportions of abrasive fillers	Suitable for finishing to roughing non-ferrous metals and non-ferrous materials with highly abrasive fillers. High chip removal volume on fiber-reinforced plastics such as CFRP and GFRP	Suitable for fine finishing and finishing all non-ferrous materials and non-ferrous metals with low to very high proportions of abrasive fillers

Cutting edge geometries

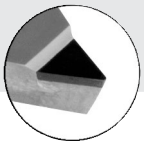
Neutral rake angle:

- Higher cutting pressure
- Higher cutting temperature
- Improved surface quality
- For more stable workpieces



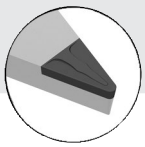
Positive rake angle: 5° / 7°

- Lower cutting pressure
- Lower cutting temperature
- Slight reduction in surface quality
- For unstable workpieces
- Improved dimensional stability



CB chip breaker geometries:

- Reliable chip control
- Ideal for low-alloy aluminum
- For F | M | R applications



Notes on diamond usage

- Coolant is not generally needed, however it does facilitate chip removal
- Note the chemical reaction to carbide-forming elements (PCD)
- Note the thermal interaction and critical temperature:
  PCD: 600 °C (1112 °F), CVD: 700 °C (1292 °F)
  Depending on the material, use cooling.

The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material, and type of machine. The specified values represent guideline cutting data that must be corrected according to the usage conditions!

O.3.1										

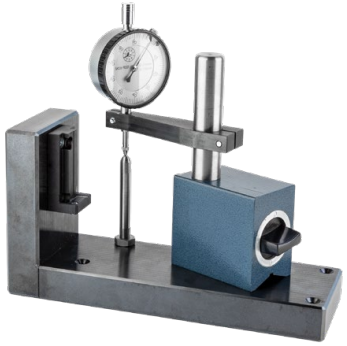
The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material, and type of machine. The specified values represent guideline cutting data that must be corrected according to the usage conditions!

Adjustment device

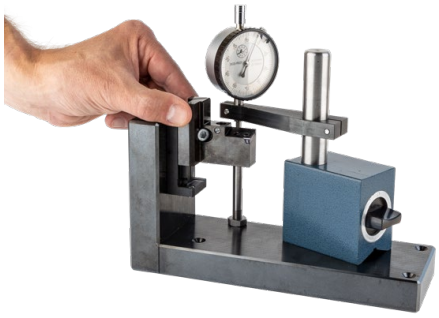
The adjustment device is profitable if the tool system is expanded with several tool holder blocks on several machines. The tool system can be preset so that the holder on every machine demonstrates the appropriate center height in relation to the turning center of the machine.

Adjustment device

1. Zero the dial gage on the surface of the measuring stick.



2. Place tool holder block on the device and gently tighten the clamping screw until the holder sits on the device free of play. Ideally, set the center height slightly below the center, so that the tool holder block is pushed upward when the height is set.

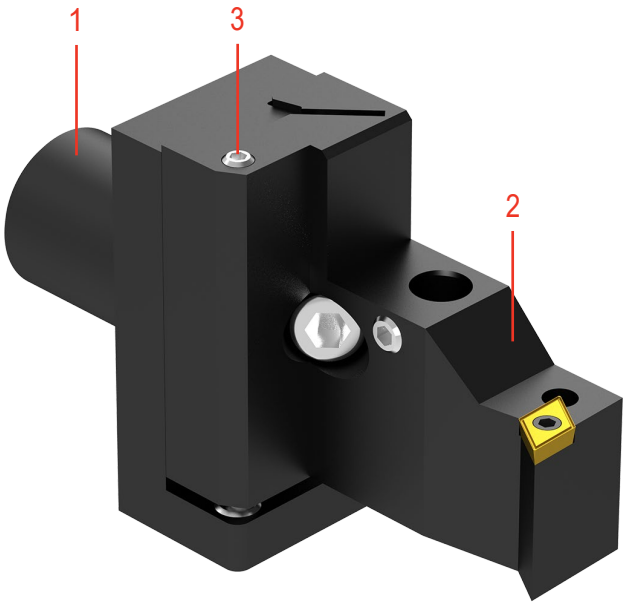


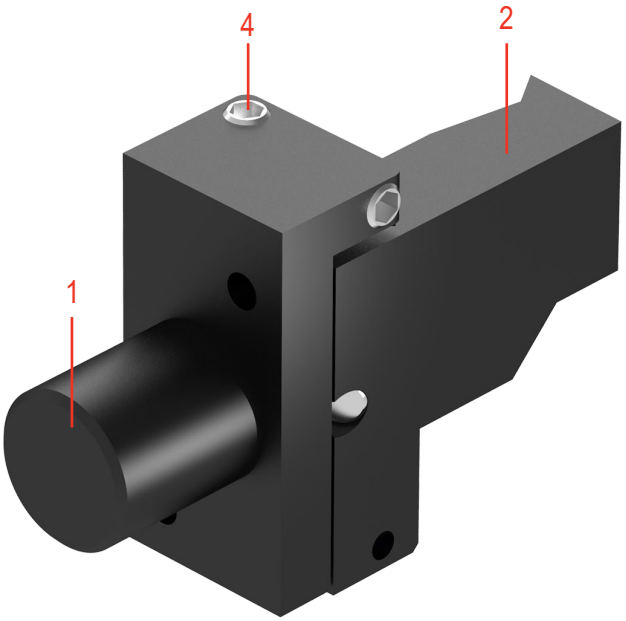
3. Carefully place the dial gage on the tip of the tool's cutting edge.

4. Adjust the height adjustment screw until the dial gage is set to zero.

Procedure when retrofitting on the CT tool system

1. Screw all base holders (1) into the machine.
2. Clamp the height-adjustable screw (4) of the individual base holders (1) and set to the same height using the dial gage.
3. Clamp a tool holder block (2) onto any base holder (1) and set precisely on the turning center using the height-adjustable screw (3) of the tool holder block (2).
4. Remove the tool holder block (2) from the machine and clamp it on the height presetting device.
5. Set the dial gage on the tool to zero and adjust the measuring pin on the presetting device.
6. Each additional tool holder block (2) is set to zero once on the presetting device using the measuring pin and dial gage.





If several tool holders are arranged side-by-side, you can quickly and reliably fix them at the same height using height adjustment screws (3) and (4).

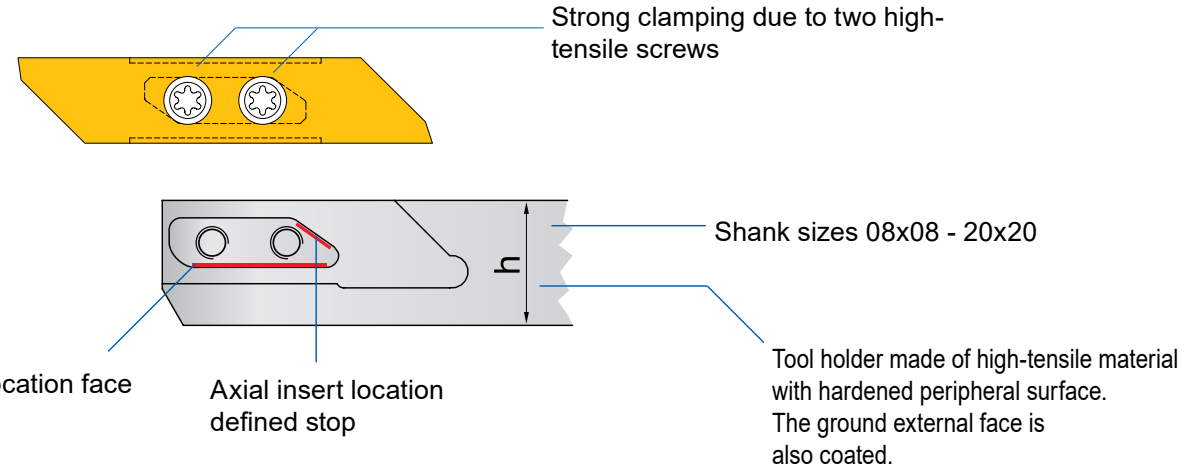
The same tool holders (2) can be used for multiple machines without presetting them again individually. However, the base holders (1) of the other machines must be adjusted to one another.

This is done as follows:

1. Screw all base holders into machine 2.
2. Clamp a preset tool block holder from machine 1 on any base holder in machine 2 and adjust the turning center precisely using the height-adjustment screw of the base holder.
3. Set all other height-adjustable screws on the rest of the base holders in machine 2 to the same height using the dial gage. The preset tool block holders can thus be used on each tool station of several machines without readjustment.

VertiClamp

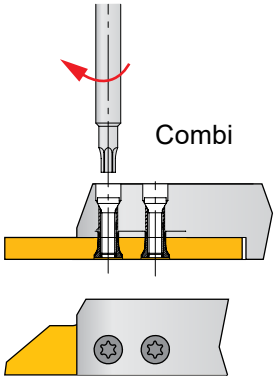
Features



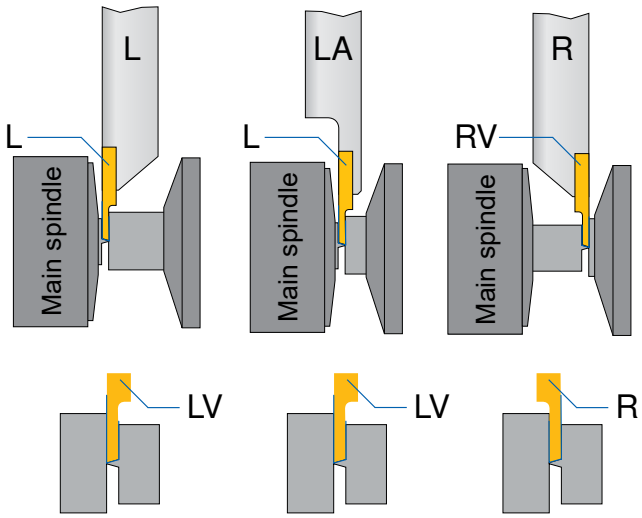
Advantages

- The connection between the indexable insert and tool holder guarantees optimum fixation
- The second cutting edge can always be used, even if the first cutting edge is broken off
- Shearing forces do not act on the screws
- For all cutting edge forms, the overhang of the cutting edge from the tool holder is identical
- Vertical insert orientation maintained thanks to large seating surface
- The indexable insert seat is completely protected from chips
- Inserts are clamped through two high-tensile screws and a tapered axial stop of 30° in all cutting directions

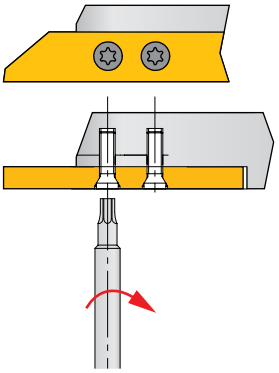
Clamping the cutting edge with combi holders



Parting off with counter spindle



Clamping the cutting edge with standard holders

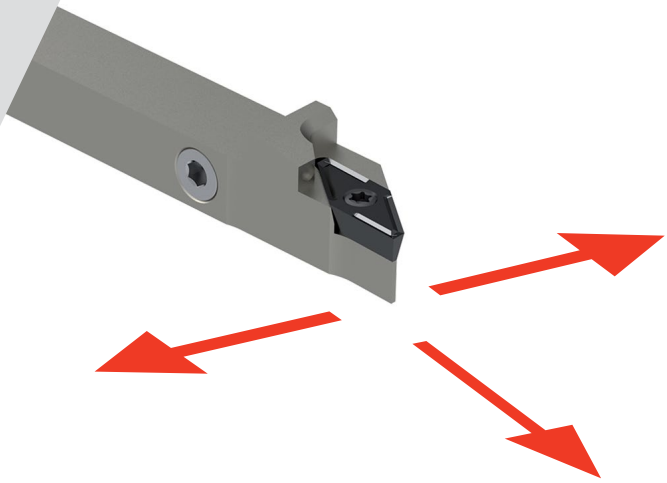


TriClamp

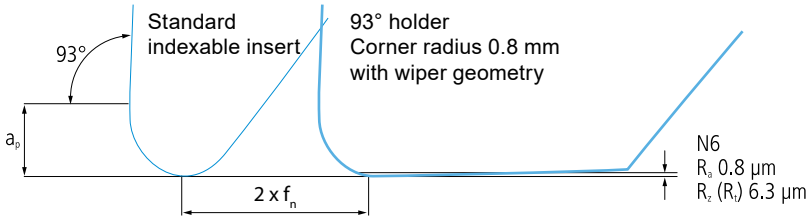
By using TriClamp with a wiper geometry and the 93° holder, it is possible to achieve up to double the feed rate. This means that machining times can be significantly reduced while maintaining the same quality, or the surface quality can be improved in the same machining time. The ability to machine in a radial direction and in both axial directions makes this system particularly flexible.

Advantages

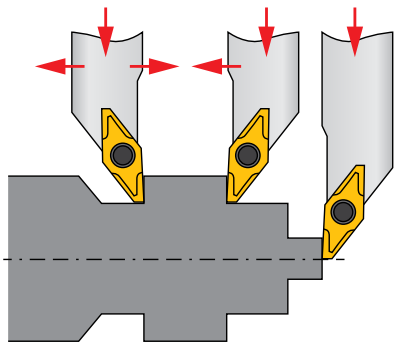
- Expansion of the ISO range
- Turning in three directions
- All cutting edges can easily be replaced
- Sharp positive edges with 11° clearance angle
- Small corner radii of 0.08 mm and 0.2 mm
- Perfect chip control
- Special holders for sliding head lathes (shanks 8x8 mm to 16x16 mm)



Wiper geometry in detail:

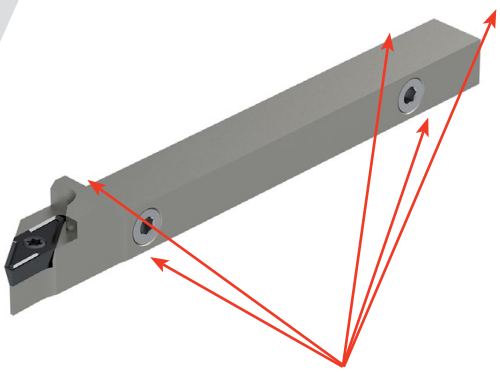


Applications:



Tool holders with a through coolant supply enhance the performance of indexable inserts and improve component quality, especially when machining difficult materials such as stainless steels and super alloys.

- All IC holders have five coolant supply options
- Made of highly tempered steel
- Precise coolant jet on the cutting edge
- Can be used at any coolant pressure



Coolant connection options

XheadClamp

Fast tool changes with high repeatability have become a competitive advantage in series production, which usually has to be carried out with the highest possible output. CERATIZIT meets this production requirement with the newly developed XheadClamp holder system. Time savings and an extremely short setup process are key advantages of the system. Furthermore, the XheadClamp system impresses with its flexibility and ease of use. Changing the indexable insert, switching to a different geometry, and changing from turning to grooving inserts can all take place quickly and easily with the XheadClamp – and with the highest precision.

Clamping

- Very high clamping forces
- Release and clamping of an exchangeable head with just one screw
- Repeatability of less than ±7.5 µm
- Maximum stability

Versatility

- All heads can be installed regardless of system size
- Tools can be adapted to the component
- Fastest indexable insert change thanks to exchangeable head

Accuracy

- No variable X and Y dimensions when changing the head
- Repeatability of less than ±7.5 µm
- Center height is retained even when the insert size is changed
- Two-nose system guarantees the correct position

Interrupted cut

Advantages

Whether you are turning face, inside and outside profiles or drilling with a stationary or rotating tool, EcoCut is the leading tool for a number of applications. EcoCut tools are available in three versions: EcoCut – Mini, EcoCut – Classic, EcoCut – ProfileMaster and the new EcoCut – Solid.

- Shorter machining time
- Fewer tool stations required
- Creates a flat bottom hole
- Less time and effort spent on programming
- Lower set-up costs / Reduced pre-setting times
- Time is saved due to fewer tool changes

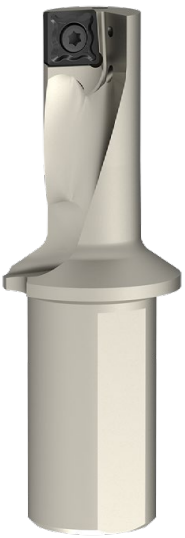
Turning tool

+

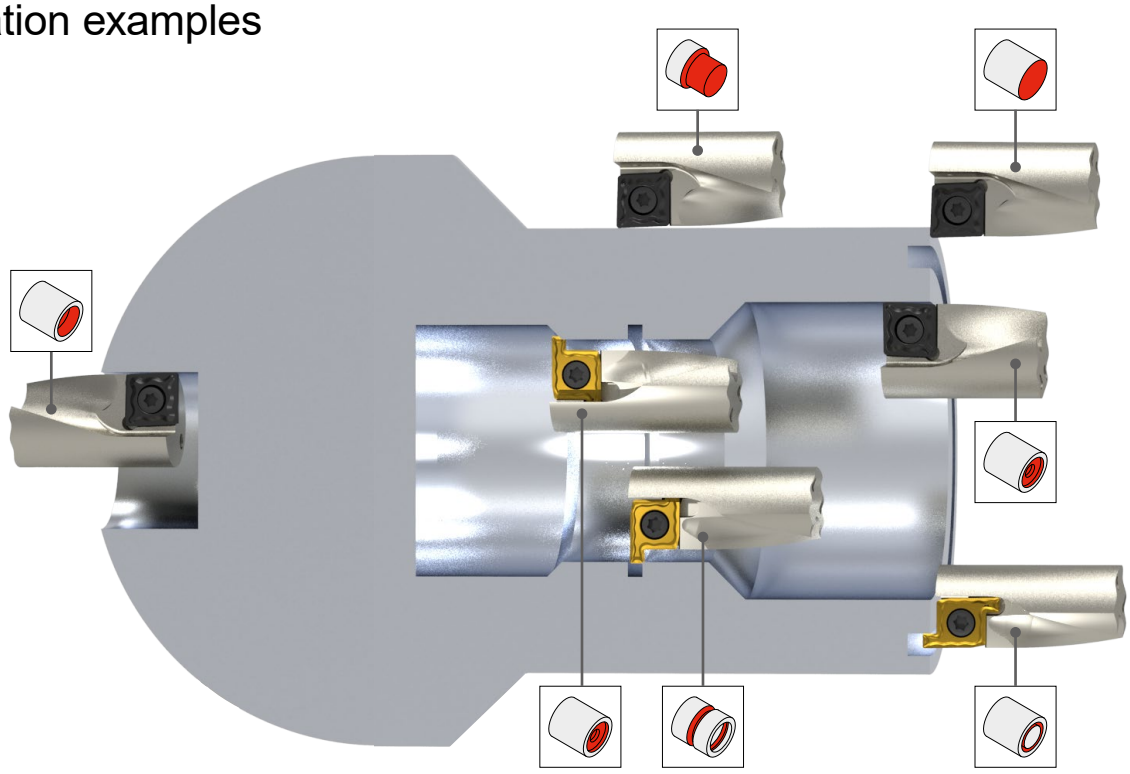
Drill

+

Boring bar



Application examples



Overview of tools

EcoCut – Mini

- For small component dimensions
  → Various sizes available
- Several applications with one tool
  → Saves time and tool stations in the machine
- Made from solid carbide
  → Increases stability even for interrupted cuts
- Through coolant supply
  → Less wear and fewer stuck chips

EcoCut – Classic

- Several applications are covered with one tool
  → Saves time and tool stations in the machine
- EcoCut – Classic is extremely high-performance and robust
  → Optimized tool geometry and reduced wear
- Highest process security
  → Indexable insert with reliable chip breaker

EcoCut – Solid

- No vibrations
  → Underlying processing that is process-secure
  → High surface quality
  → For demanding tolerances
  → Longer tool life of the insert
- Solid carbide holder material
  → Longer service life of the tool
  → Stable and robust
  → Zero to very little displacement
- The entire tool holder including insert seat is made from solid carbide, which has a high density as well as a higher modulus of elasticity. The material properties of carbide make a considerable contribution to dampening vibrations.

EcoCut – ProfileMaster

- Saves time and tool stations in the machine
- No radial and axial plunging operations possible
- Machining of undercuts
- Turning of inside profiles

Stability comparison

The following provides a comparison of the three different holder materials (solid carbide, Densimet, steel).

Material Modulus of elasticity (E modulus) Density	
Carbide 550.000 MPa 14,1 g/cm³	Densimet 360.000 MPa 17,5 g/cm³	Steel 210.000 MPa 7,85 g/cm³	

It is clear to see how differently the various materials behave at the same load.

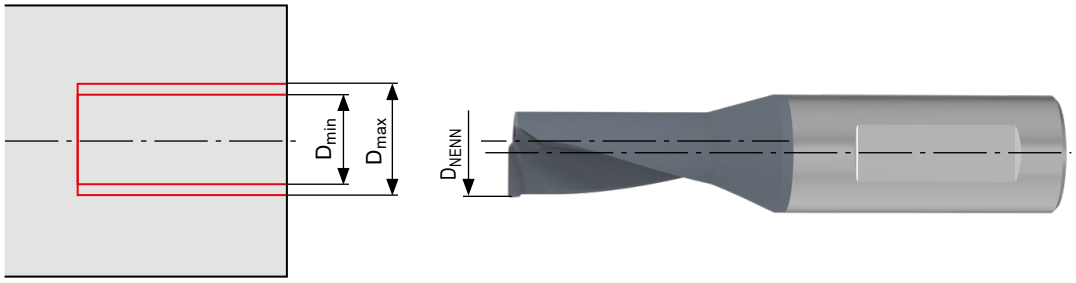
EcoCut – Mini – Application tips

Drilling off-center

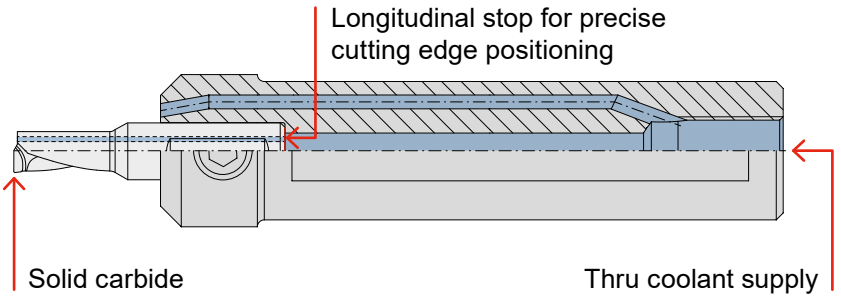
Thanks to the special design, EcoCut tools can perform off-center drilling. Therefore corresponding deviations from the nominal tool diameter can be achieved.



Size	Tool nominal Ø	Workpiece hole Ø	
	D_{NENN} (mm)	D_{min} (mm)	D_{max} (mm)
ECM 02	2	1,95	2,1
ECM 02,5	2,5	2,45	2,6
ECM 03	3	2,95	3,15
ECM 03,5	3,5	3,45	3,65
ECM 04	4	3,90	4,20
ECM 05	5	4,90	5,20
ECM 06	6	5,90	6,20
ECM 07	7	6,90	7,20
ECM 08	8	7,90	8,20

Mini – Adapter

Cross-section rotated by 90° for clarity

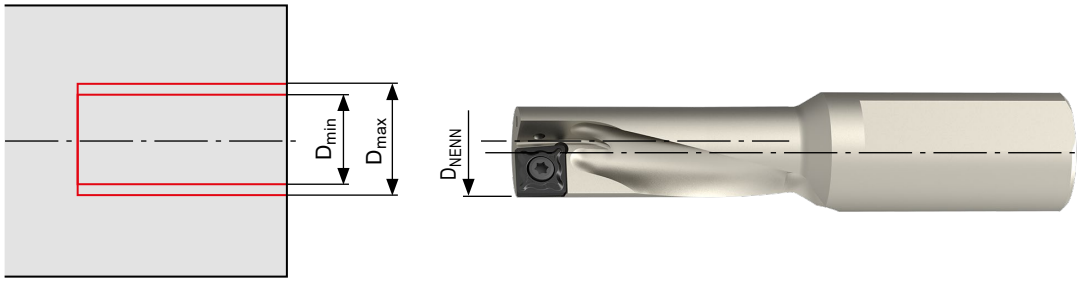


In order to guarantee efficient chip transport out of a hole, the coolant pressure must be at least 3 – 6 bar (ideally 7 – 10 bar).

EcoCut – Classic – Application tips

Drilling off-center

The special design of the tool and indexable insert enables EcoCut tools to perform off-center drilling. Therefore corresponding deviations from the nominal tool diameter can be achieved.

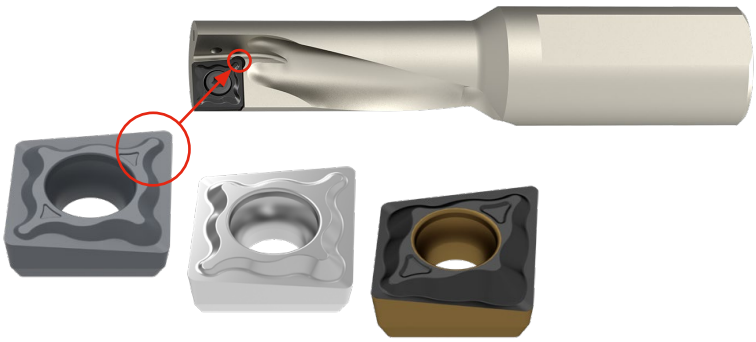


Size	Tool nominal Ø D_{NENN} (mm)	Workpiece hole Ø D_{min} (mm)	Workpiece hole Ø D_{max} (mm)
ECC 08	8	7,85	8,30
ECC 10	10	9,85	10,50
ECC 12	12	11,85	12,50
ECC 14	14	13,85	14,50
ECC 16	16	15,85	16,50
ECC 18	18	17,85	18,50
ECC 20	20	19,80	20,50
ECC 25	25	24,80	25,80
ECC 32	32	31,80	33,00

Mounting of the indexable insert

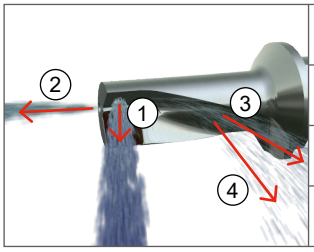
For tools up to Ø 8 mm / 0.315" right and left handed inserts are required.
From Ø 10–32 mm / 0.394"–1.260" neutral inserts are used.

Caution!
Ensure correct orientation upon installation.



Innovative chip removal – Chip-Booster

EcoCut tools are equipped with a unique coolant and chip removal system.



①	Cooling of the indexable insert
②	General coolant and flushing stream
③	Chip-Booster for chip transport in the chip space
④	Chip-Booster prevents chips from getting stuck between the tool and workpiece

In order to guarantee efficient chip transport out of a hole, the coolant pressure must be at least 3 – 6 bar (ideally 7 – 10 bar).

EcoCut– Classic – Application as the most stable boring tool

EcoCut is not just suitable as a multi-function tool. EcoCut also provides enormous advantages to the user as a pure boring tool compared to a boring bar.

Example: machining bores, 0.629" (16 mm) diameter by 1.420" (36 mm) depth

Differences in the tool

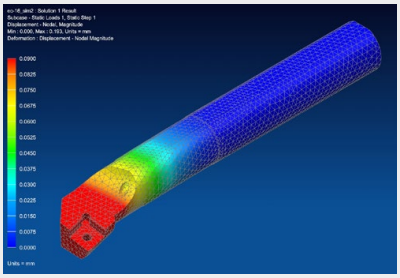
Boring bar	**EcoCut –** Classic	**Your benefits**
A12K SCFCR 06	**ECC 16R-2.25D 08**	
		**Stable solid base body** ▲ Able to handle higher cutting forces ▲ Less vibration ▲ Chip-Booster for perfect cooling and chip clearance **Benefits** ▲ High surface quality ▲ Perfect chip breakage ▲ Unbeatable process security

Differences in the indexable inserts

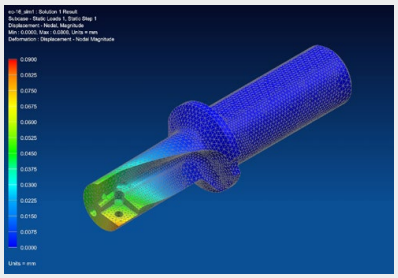
CCMT 060204	**XCNT 080304**	**Large and stable indexable insert**
		▲ Increased process security ▲ Enables large cutting depths ▲ Higher cutting data ▲ Longer tool life **Benefits** ▲ Reduces the machining time ▲ Increased productivity ▲ Reduction in tool costs

Stability comparison

Calculation via FEM
At a load of 1000 N on the insert seat corresponds to approx. a_p = 2.0 mm and f = 0.2 mm



Deflection 0.007" (0.19 mm)



Deflection 0.003" (0.08 mm)

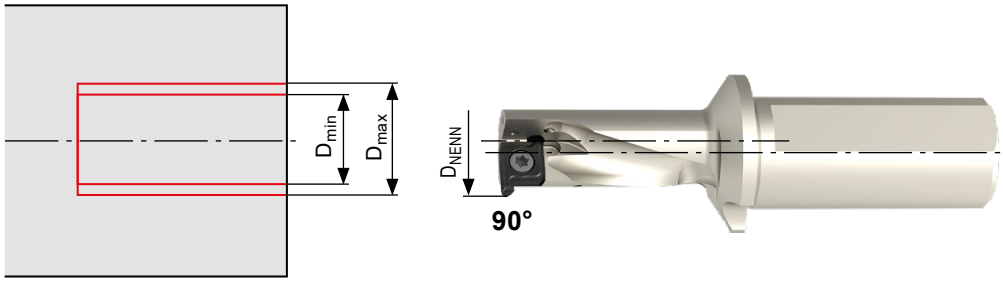
Experience shows that:

- ▲ Machining time reduced by up to **75%**
- ▲ Tool life increase of up to **400%** possible

EcoCut – ProfileMaster – Application tips

ProfileMaster 90° – Drilling off-center

The special design of the tool and indexable insert enables EcoCut tools to perform off-center drilling. Therefore corresponding deviations from the nominal tool diameter can be achieved.



Size	Tool nominal Ø D_{NENN} (mm)	Workpiece hole Ø D_{min} (mm)	Workpiece hole Ø D_{max} (mm)

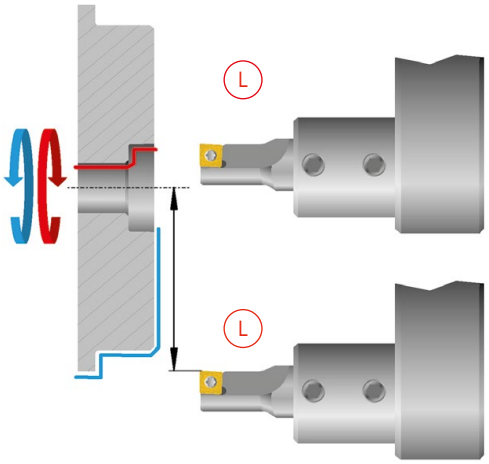
Troubleshooting

Machining over center

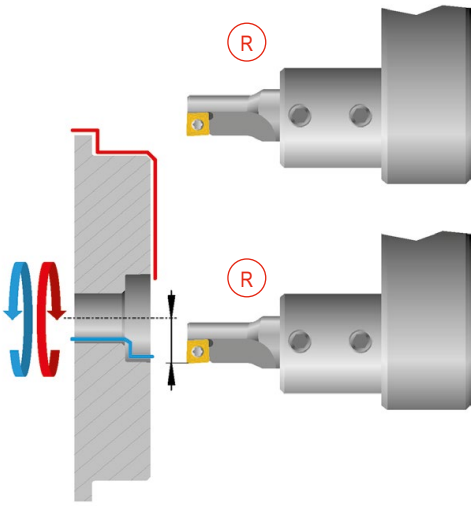
Problems

If the machine is unable to move freely over the central axis, the outer diameter cannot be machined with the same tool.



Solution

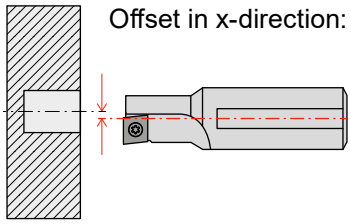
Use a right hand EcoCut tool.



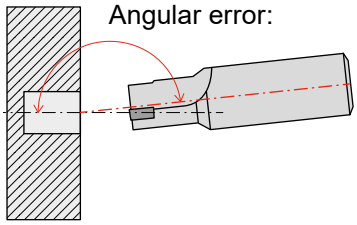
With axial offset there is the danger of collision!

Problems

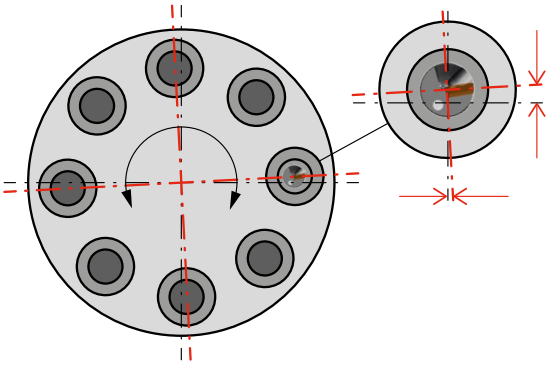
Offset in x-direction:



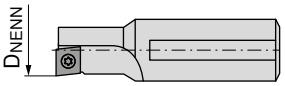
Angular error:



Turret position error:

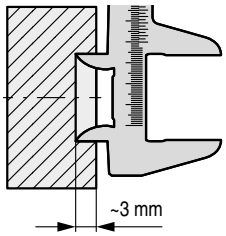


Solution



When pre-setting the tool:

- Definition as an internal turning tool for programming
- Enter the tool nominal Ø as hole target Ø



At the machine:

- Make measuring cut, approx. 0.120" (3 mm) deep
- Determine bore diameter produced
- If necessary correct drilling Ø
- Start machining

MaxiChange – Program overview

As the MaxiChange exchangeable head system is modular, it is extremely flexible and can be used for a variety of applications thanks to the wide selection of exchangeable heads. On top of these advantages, the MaxiChange GX also includes a grooving function for internal and external machining as well as axial and radial machining.

The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material and type of machine. The specified values represent guideline cutting data that can be adjusted by approximately **±20%** according to the usage conditions.

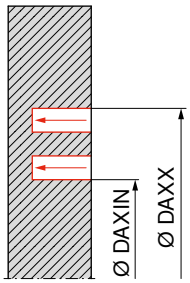
Machining notes

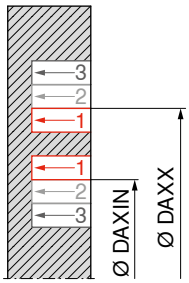
Axial grooving



It is only possible to groove within the fixed diameter range of the axial grooving module or axial monoholder (e.g., 50 – 70 mm).

Important: The indicated diameter range is always valid for the external diameter of the groove!

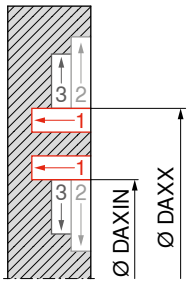
Axial grooving – groove widening



In the case of face turning, it is possible to widen the groove above and below the diameter range indicated on the axial grooving module or monoholder.

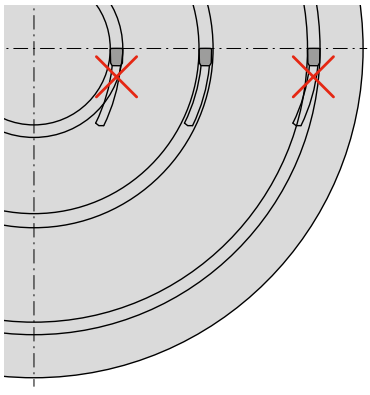
Important: Only the first groove must lie within the diameter range of the axial grooving module or axial monoholder. The depth of the widening groove must not be larger than the depth of the original groove.

Axial grooving and face turning



Groove widening by face turning in the diameter range above and below the values specified for the axial grooving module and axial monoholder is possible.

Important: Only the first groove must lie within the diameter range of the module.



Attention: The diameter of face grooves must lie within the diameter range indicated on the axial grooving module and axial monoholder. Not following this range will result in the tool being damaged or destroyed.

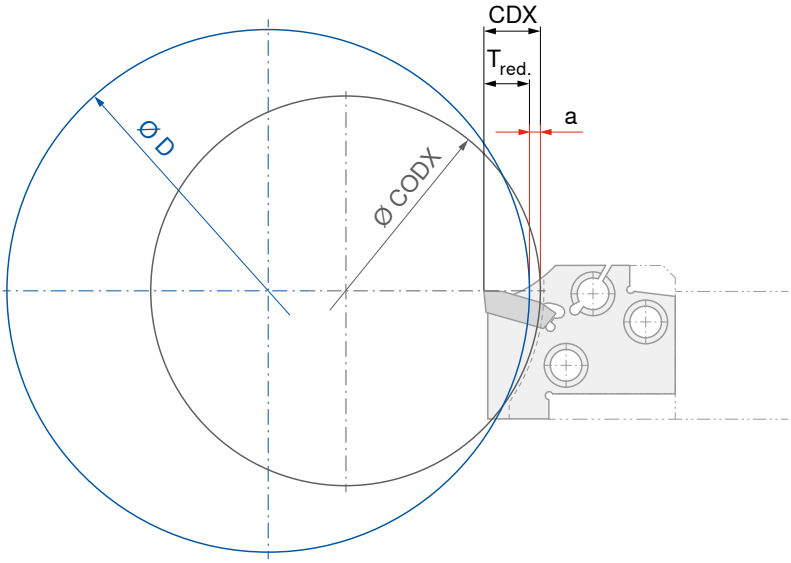
ModularClamp – Grooving depth reduction

Depending on the size, the ModularClamp grooving modules are designed for use with a specific workpiece diameter CODX. If the workpiece diameter is larger than the CODX of the grooving module, the achievable groove depth is reduced by the dimension "a". The extent of the reduction is determined using the following table.

Size		Reduction a (mm) of the maximum grooving depth (CDX)															
		0,5	1,0	1,5	2,0	2,5	3,0	3,5	4,0	4,5	5,0	5,5	6,0	6,5	7,0	7,5	8,0
E12	35	40	45	60	75	115	> 250										
E16	50	55	60	70	80	100	130	200	> 420								
E20	60	65	70	75	85	95	110	130	165	220	> 330						
E25	75	80	85	90	100	110	125	140	160	190	240	320	> 500				
E32	95	100	105	110	120	125	135	145	160	180	200	225	270	320	400	530	> 800
		Workpiece diameter D (mm)															

Maximum workpiece diameter (CODX) with full groove depth (CDX) in mm

Calculation example:



CDX =
Maximum grooving depth (mm)

CODX =
Maximum workpiece Ø with full groove depth (mm)

a =
Reduction amount (mm)

$T_{red.} = CDX - a$

E25R**21**-GX24-3

21 = CDX = 21 mm, Ø CODX = 75 mm

E25 = Size 25

Workpiece diameter
D = Ø 100 mm

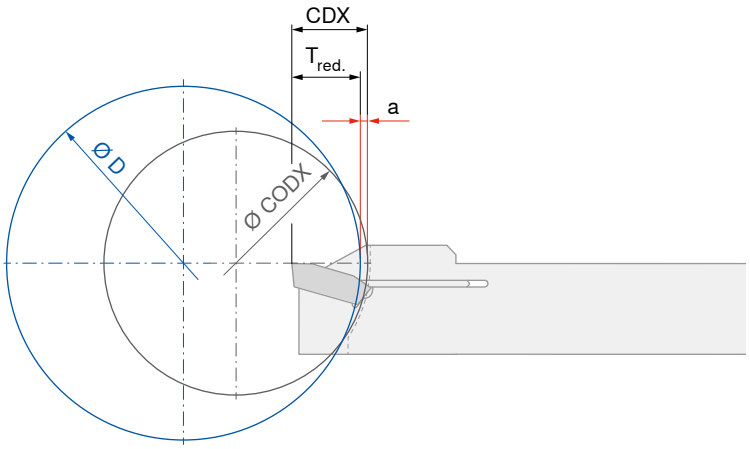
$T_{red.} = CDX - a = 21 - 2 = 19$ mm

MonoClamp – Grooving depth reduction

Depending on the groove width and shank size, the MonoClamp tools are designed for use with a specific workpiece diameter CODX. If the workpiece diameter is larger than the CODX of the grooving module, the achievable groove depth is reduced by the dimension "a". The extent of the reduction is determined using the following table.

Shank			Reduction a (mm) of the maximum grooving depth (CDX)								
			0,5	1,0	1,5	2,0	2,5	3,0	3,5	4,0	4,5
	E12R/L0022...	44	70	80	95	115	150	225	> 450		
	E16R/L0026...	52	90	105	125	155	210	305	> 600		
	E20R/L0026...	52	110	125	140	160	195	240	320	475	> 950
	E20R/L0033...	66	110	125	140	160	195	240	320	475	> 950
	E25R/L0026...	52	140	160	190	235	310	465	> 930		
	E25R/L0033...	66	155	175	200	230	275	340	450	675	> 1350
	E25R/L0040...	80	155	175	200	230	275	340	450	675	> 1350
			Workpiece diameter D (mm)								
			Maximum workpiece diameter (CODX) with full groove depth (CDX) in mm								

Calculation example:



CDX =
Maximum grooving depth (mm)

CODX =
Maximum workpiece Ø with full groove depth (mm)

a =
Reduction amount (mm)

$$T_{red.} = CDX - a$$

E25R0033...

CDX = 33 mm, Ø CODX = 66 mm

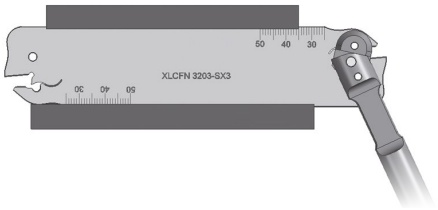
Workpiece diameter
D = Ø 200 mm

$T_{red.}$ = CDX – a = 33 – 1,5 = 31,5 mm

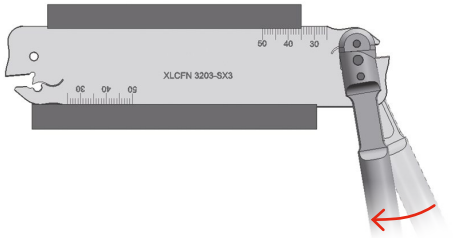
Clamping function – SX system

System function – inserting and removing the cutting inserts

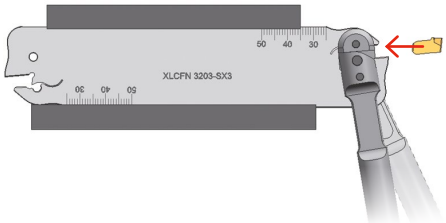
Precision system for inserting and removing the cutting inserts.
The key has been designed in such a way that it will not stress the material beyond its "elastic limit".
With this alternate system, the material always remains in its flexible range and provides a substantial increase in tool life.



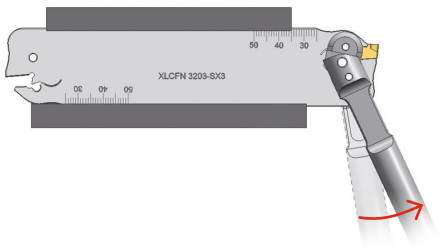
1 Push the assembly key into the two recesses with the handle facing forwards.



2 By moving the assembly key in the direction of the arrow, the insert seat in the tool opens.

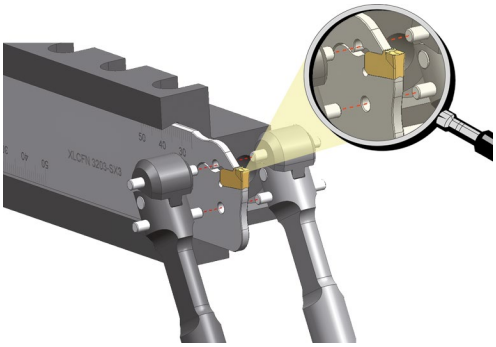


3 Insert the grooving insert and position it by pressing it against the stop.



4 Move the assembly key forwards. The insert seat closes again and the grooving insert is clamped.

When changing the indexable inserts, always maintain tension on the key!

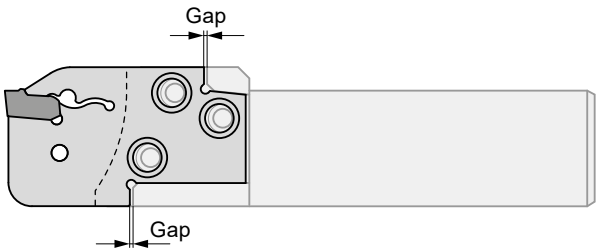


The clamp is designed so that the assembly key can be inserted from both sides of the blade according to the accessibility.

Maximum blade projection during longitudinal turning

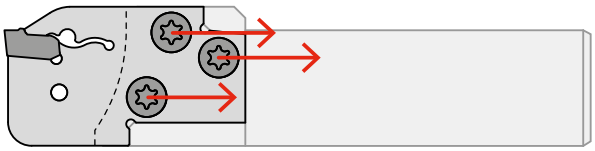
Blade	max. overhang (mm)
SX 2 – SX 3	25
SX 4 – SX 5	30
SX 6	35

Clamping function – ModularClamp modules



Module unclamped

- Gap between module and face contact for axial clamping

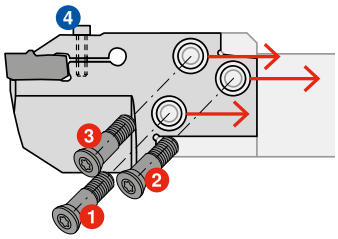


Module clamped

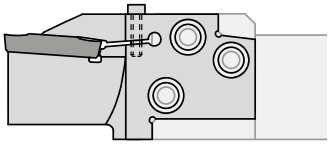
- Axial clamping with face contact
- Connection free from play, therefore maximum stability

System

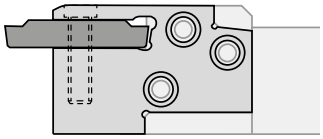
LX



GX 24



AX

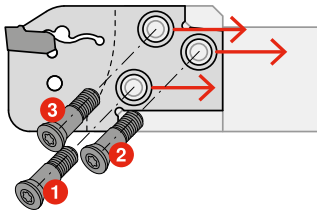


Active indexable insert clamping

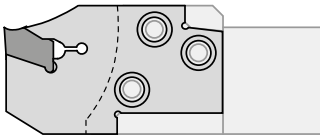
Clamping screws 1, 2, and 3 are used for clamping the module.
The grooving insert is retained in the module via the additional screw 4.

System

SX



FX

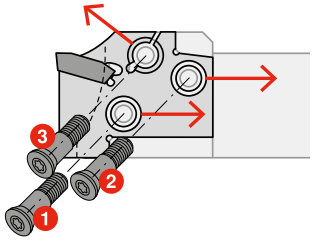


Self clamping of the indexable insert

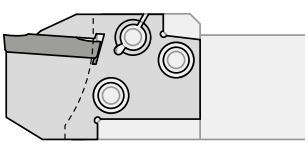
Clamping screws 1, 2, and 3 are used for clamping the module.
The grooving insert is self-clamping.

System

GX 09 / GX 16



GX 24

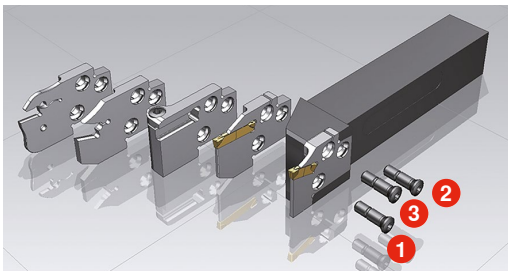


Active indexable insert clamping

Clamping screws 1 and 2 are used for clamping the module.
Important: First tighten clamping screws 1 and 2. Then clamp the grooving insert with screw 3.

Tightening torque ModularClamp module screws

Base holder



Base holder	Screw	Torx	Recommended tightening torques	
			Nm	in.lbs

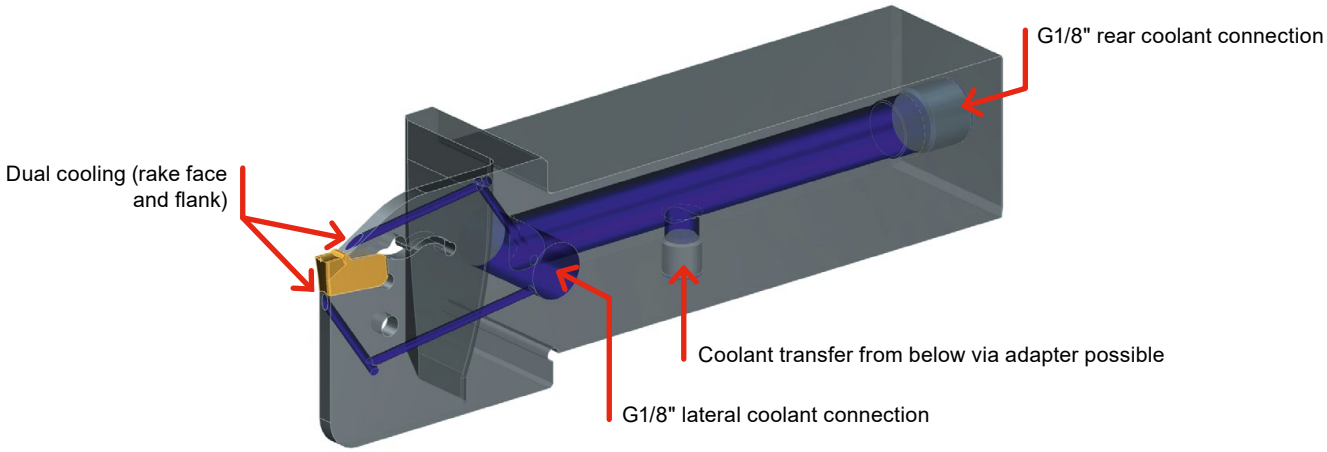
Advantages due to DirectCooling

Internal coolant supply with groove machining has a decisively positive effect on your turning process.
In our CERATIZIT grooving range, the following grooving systems have an internal coolant supply:

- **SX** Grooving holder (single tool)
- **GX** grooving holder (single tool)

Advantages of DirectCooling

- Improved chip control
- Longer tool life of the insert
- Greater process security
- Application of higher cutting data

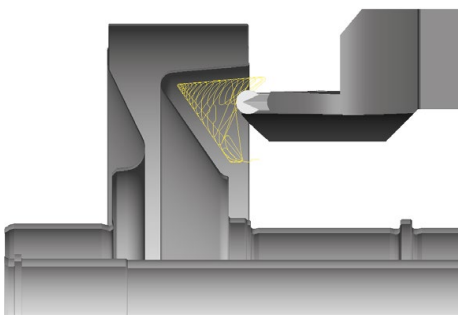


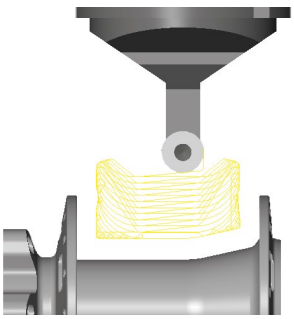
Advantages of the trochoidal turning strategy

- Less wear and longer tool life due to softer entry and exit
- Smaller angle of engagement = less vibration
- Up to 40% higher feed rate values possible
- Broad field of application in austenitic steels, heat-resistant steels, Inconel, and nickel-base alloys as well as long-chipping ductile materials
- Savings on tools

Trochoidal turning with support of the following CAM systems:

- hyperMill – High-performance turning
- Esprit CAM – ProfitTurning
- SolidCAM – Turning
- EdgeCAM – Waveform turning
- MasterCAM – Dynamic Turning



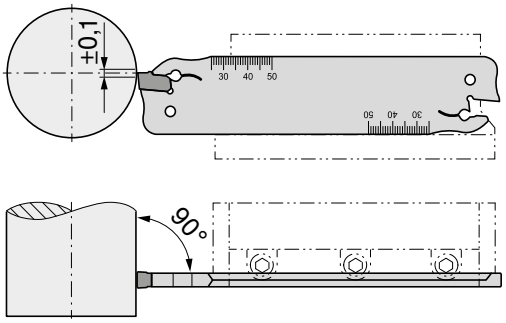


Possible applications

- Radial and axial recesses and grooves
- Rough machining – high-feed milling with button insert

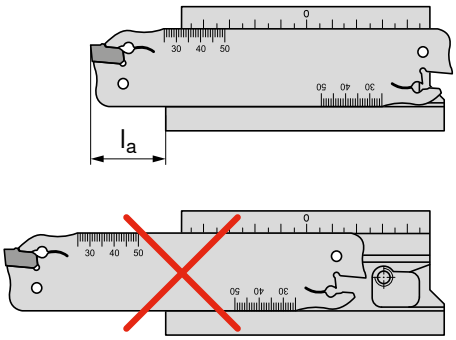
General information

Tool position

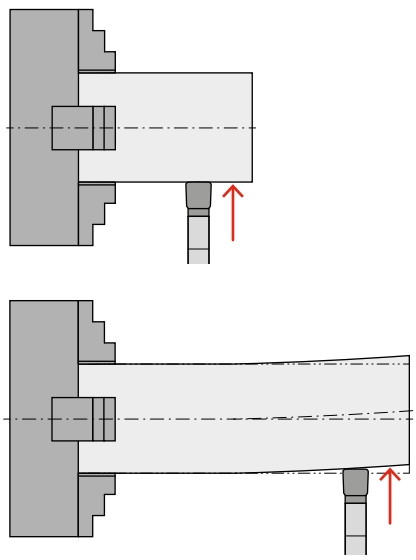


Tool overhang

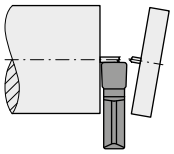
As a rule of thumb: Overhang l_a should not be greater than 8 x CW (groove width).



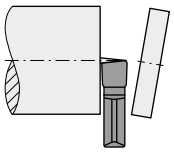
Workpiece overhang



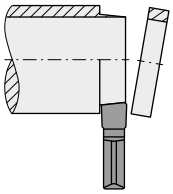
References for parting off



From Ø 5 mm on, reduce feed "f" by approximately 50 %. Do not cut across the center (risk of breakage).

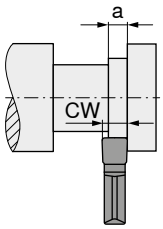


For "pip-free" parting off, use R or L inserts. To minimize lateral deflection forces, reduce the feed rate by approximately 20-50 %.

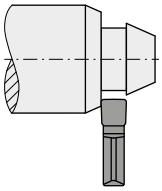


To prevent ring formation, use R or L inserts. Reduce feed "f" by approximately 20–50 % because of lateral deflection.

References for grooving



When grooving with an axial displacement, the "a" width should equal at least 70 % of the "CW" groove width.



When grooving oblique surfaces, the feed must be reduced by approx. 20–50 % until fully engaged.

Recommendation for optimum results

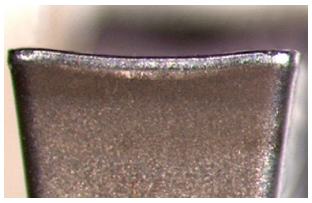
Wear causes

Flank wear



Abrasion on the flank, normal wear after a certain period of operation.

Cause

- Cutting speed too high
- Carbide grade does not have enough wear resistance
- Insufficient coolant

Solution

- Reduce the cutting speed
- Choose carbide grade with greater wear resistance
- Improve coolant feed

Chipping

Increased mechanical stress on the cutting edge may result in carbide particles breaking off.

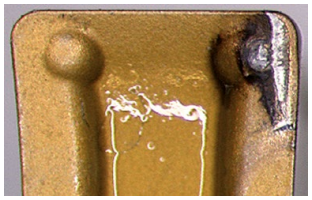
Cause

- Grade with too high a wear resistance
- Vibrations
- Feed rate or cutting depth is too high
- Chip stroke

Solution

- Use tougher grade
- Use negative cutting edge geometry with a chip breaker
- Reduce overhang; check center height
- Stabilize the cutting edge

Crater wear



The outgoing hot chip is causing cratering of the cutting insert on the clamping flat.

Cause

- Cutting speed, feed rate, or both are too high
- Rake angle too low
- Grade does not have enough wear resistance
- Incorrectly supplied cooling

Solution

- Reduce cutting speed and/or feed rate
- Increase quantity and/or pressure of coolant, check supply
- Use a more crater-resistant grade

Plastic deformation

Large mechanical load produces high machining temperatures; this can lead to plastic deformation.

Cause

- Working temperature too high, softening of the base material
- Unsuitable grade
- Inadequate coolant supply

Solution

- Reduce the cutting speed
- Choose carbide grade with greater wear resistance
- Use coolant

Built-up edge formation

Material builds up on the cutting edge if the chip does not flow correctly due to the cutting temperature being too low.

Cause

- Cutting speed too low
- Rake angle too small
- Incorrect cutting material
- Lack of cooling/lubrication

Solution

- Increase the cutting speed
- Increase rake angle
- Use TiN coating
- Use thicker emulsions

Notch wear

Contraction at maximum cutting depth.

Cause

- Oxidation on the cutting edge
- Too high a temperature at the edge

Solution

- Use different cutting depths
- Reduce cutting speed
- Improve coolant feed

System overview

UltraMini

- From Ø 0.5 mm
- Flexible system
- Ground inserts
- High repeatability
- Coolant supply to the cutting edge

MiniCut

- From Ø 7.8 mm
- Stable three-rib interface
- Easy handling
- Coolant supply to the cutting edge
- Precise cutting edge position

SlotCut

- Broaching directly on the machine
- Usable from Ø 6 mm
- Low machine load
- Variety of tolerance classes

The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material, and type of machine. The specified values represent guideline cutting data that can be adjusted by approximately **±20%** according to the usage conditions.

The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material, and type of machine. The specified values represent guideline cutting data that can be adjusted by approximately **±20%** according to the usage conditions.

Broaching – Recommendations for correct use

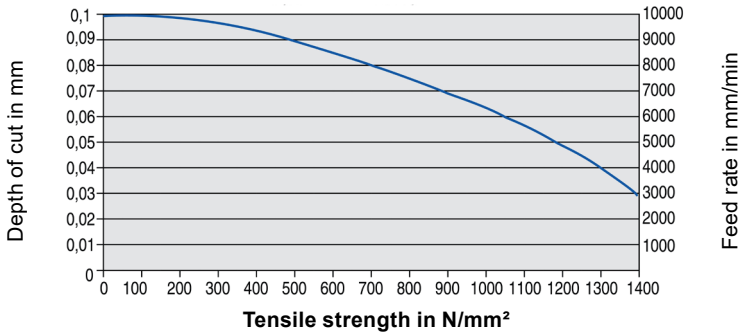
SlotCut

An increasing number of single parts or small and mid-sized series require high-precision slots.
A tool system that is specially designed for broaching is required in order to machine these slots directly in one clamping set-up on the respective machine.

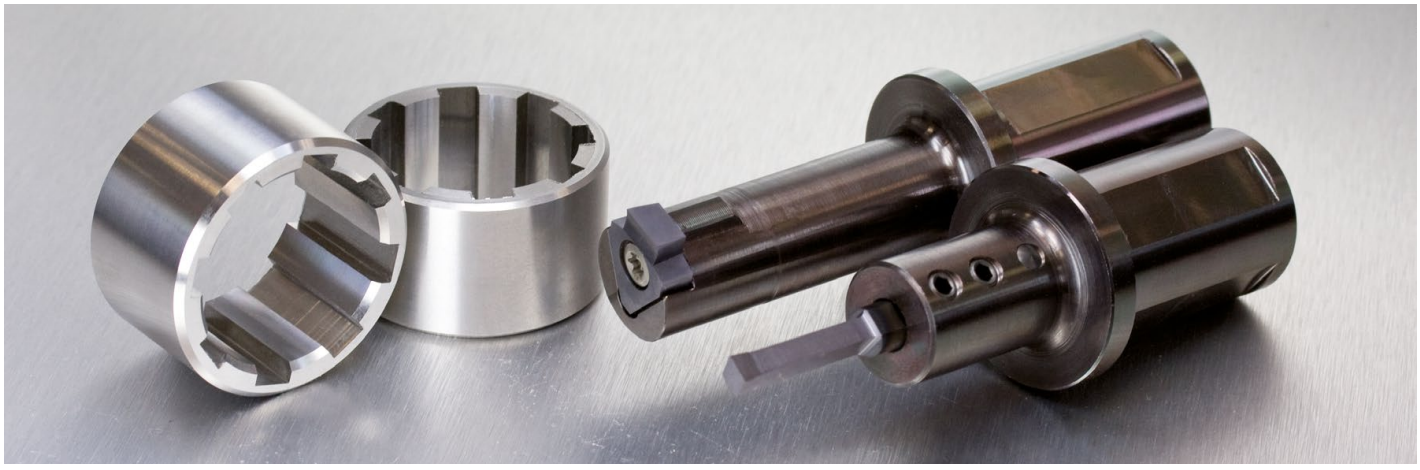
The SlotCut system can be used to machine slots in the most common slot tolerances and offers four ways of doing this. Two of these are based on a complete carbide solution that works especially well with small diameters.
The versions with bolted inserts are ideal for larger diameters.

This makes broaching a cost-effective process on both turning machines and machining centers, delivering high-precision results in next to no time.

Approximate broaching values



The data is strongly influenced by the external conditions and is only intended as a guideline that will need to be adjusted up or down depending on the stability of the machine, application, and material.



Tips for the user

- Avoid interrupted cuts.
- If possible, broach the slot at the top of the component so the chips drop down.
- Make sure that the tool is not impeded at the end of the slot.
- Lift the tool out of the slot as you retract it from the material.
- Use coolant to increase the tool life and surface quality.
- Adjusting the tool is essential, so take note of the tool diameter.

Coatings

TiAlN+
- TiAlN multilayer coating
- Maximum application temperature: 1000 °C or 1832 °F

TiN
- TiN coating
- Maximum application temperature: 450 °C or 842 °F

TiAlN
- TiAlN multilayer coating
- Maximum application temperature: 900 °C or 1652 °F

CWX500
- Carbide, TiAlN-coated
- The universal carbide grade for almost all materials

DPX77S
- TiAlN+X coating
- Maximum application temperature: 900 °C or 1652 °F

Grade description

K10F
- Carbide, uncoated
- ISO | **K10**
- Uncoated carbide grade for machining grey cast iron or non-ferrous metals, depending on the cutting edge geometry

Thread types

M ISO metric coarse thread

MF ISO metric fine thread

G Whitworth thread

Tr ISO metric trapezoidal thread

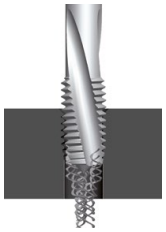
Tool types

TruTap

TruTap through hole taps

- For through hole threads to 4xD
- Chamfer form B: 3.5–5 pitch lead with spiral point
- Straight flute
- Suitable for synchronized machining and other applications, with Weldon flat and in extra long version
- The special geometry of the chip flutes ensures that chips are removed in the cutting direction

TruTap DL



TruTap DL through hole taps

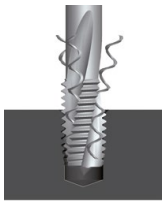
- For through hole threads to 4xD
- Chamfer form D: 3.5–5 pitch lead without spiral point
- 15° left-hand flutes
- Suitable for steel, titanium, titanium alloys, and Inconel 718
- Chips are removed in the cutting direction

CavTap

CavTap blind hole taps

- For blind hole threads up to 3xD
- Chamfer form C: 2–3 pitch lead without spiral point
- Chamfer form E: 1.5–2 pitch lead without spiral point
- (35°, 42°, 45°, 50°) right-hand flutes with helix
- Suitable for synchronized machining and other applications, with Weldon flat, in extra long version and with through coolant
- Spiral flutes with helix reliably remove chips in the opposite direction to the cutting direction

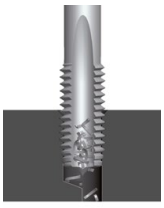
CavTap SL



CavTap SL blind hole taps

- For blind hole threads up to 2xD
- Chamfer form C: 2–3 pitch lead without spiral point
- Chamfer form E: 1.5–2 pitch lead without spiral point
- (15°, 25°, 30°) right-hand flutes with helix
- Suitable for steel, titanium, titanium alloys, and Inconel 718
- Suitable for synchronized machining and other applications, in extra-long version and with through coolant
- Can also be used for more challenging applications such as transverse holes

DuoTap



DuoTap through and blind hole taps

- For blind hole and through hole threads to 2xD
- Chamfer form C: 2–3 pitch lead without spiral point
- Chamfer form D: 3.5–5 pitch lead without spiral point
- Chamfer form E: 1.5–2 pitch lead without spiral point
- Straight flute
- For steel, short-chipping, and hardened materials up to 55 (62) HRC
- In versions including extra-long and with through coolant

DuoForm

DuoForm thread formers

- For blind hole and through hole threads to 3xD
- Chamfer form C: 2–3 pitch lead without spiral point
- For cold-forming materials up to 1400N/mm^2
- Suitable for synchronized machining, with oil grooves and through coolant

Thread types

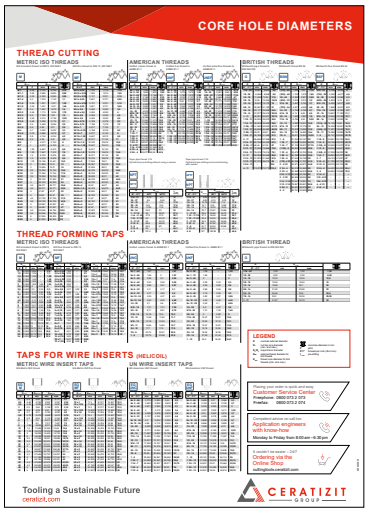
M	ISO metric coarse thread DIN 13
MF	ISO metric fine thread DIN 13
G	Whitworth pipe thread DIN EN ISO 228
UNC	Unified coarse thread ASME B1.15 and ISO 3161
UNF	Unified fine thread ASME B1.1
EG M	ISO metric coarse thread for wire thread inserts DIN 8140-2
EG UNC	EG unified coarse thread for wire thread inserts ASME B18.29.1
EG UNF	EG unified fine thread for wire thread inserts ASME B18.29.1
UNJC	Unified coarse thread ASME B1.15 and ISO 3161
UNJF	Unified extra fine thread ASME B1.15 and ISO 3161
BSW	Whitworth thread BS84
NPT	American taper pipe thread with sealing (1:16) ANSI/ASME B1.20.1
NPTF	American taper pipe thread with sealing (1:16) ANSI/ASME B1.20.3
Rc	Tapered Whitworth pipe thread (1:16) DIN EN 10226-2 (ISO7-1)
Rp	Cylindrical Whitworth pipe thread DIN EN 10226-1 (ISO7-1)

Chamfer forms

	Form B (with spiral point, 4–5 pitch lead)
	Form C (without spiral point, 2–3 pitch lead)
	Form D (without spiral point, 4–5 pitch lead)
	Form E (without spiral point, 1.5–2 pitch lead)

Cutting materials

HSS	High-speed steel
HSS-PM	High-speed steel powdered metal
HSS-E	High-performance high speed steel
HSS-E-PM	High-performance high-speed steel powdered metal
HSS-E / HM	HSS-E base support material Cutting/forming medium: HM
Solid carbide	Solid carbide



A must-have for your production processes.

Thread core hole diameters at a glance as seen on the the CERATIZIT workshop poster.

For availability, please contact your local technical sales engineer.

Application areas

UNI-HP		For universal application up to 1400 N/mm²
UNI		For universal application up to 1100 N/mm²
HR		For high-tensile steels < 1400 N/mm²
ST		Coated tap for steels up to 1100 N/mm²
ST		Uncoated tap for steels up to 750 N/mm²
VG		For tempered and heat-resistant steels < 1100 N/mm²
VA		For corrosion and acid-resistant steels
GG		For cast iron
NW		For aluminum and aluminum alloys
Soft		For soft materials
Ms		For short-chipping brass
AMPCO		For Ampco alloys
Ti		For titanium and titanium alloys
Ni		Specifically for Inconel 718
HT		For hardened steel and chilled iron up to 55 HRC

ERGO		Hand tap with guide chamfer on the taper tap for stainless, heat-resistant, and tempered steels up to 1100 N/mm²
ERGO F.T.		Hand tap for steels up to 1400 N/mm², tungsten, chilled iron
ST		Hand tap for steels
FE		Dies for steel

UNI		For universal application up to 1000 N/mm²
FE		For steels to 850 N/mm²
FE-HF		For high-tensile steels up to 1100 N/mm²
VA		For corrosion and acid-resistant steels
GG		For cast iron
AL		For aluminum and aluminum alloys
EC		DuoForm thread former for universal use
NEO		DuoForm thread former for heat-resistant alloys
NW		DuoForm thread former for aluminum

Special features

AUT	Short version for automatic use
AZ	With intermittent teeth, reduces friction
CNC	For synchronized CNC machining with minimum length compensation chuck
DRY	For dry machining or minimum quantity lubrication (MQL)
EL	Extra long, with double overall length
ES	Extra short
HML	With soldered-in carbide strips for a higher cutting speed
LH	For left-hand threads
MMB	Nut tap
NC	For synchronized CNC machining with minimum length compensation chuck
NCW	With Weldon flat for synchronized CNC machining without length compensation chuck
R_Z=1	Lapped dies
S	With separate conical lead, for deep threads
SN	Thread former with oil grooves
TS	For high-speed machining, up to 100 m/min

Dimensions in mm; P=pitch

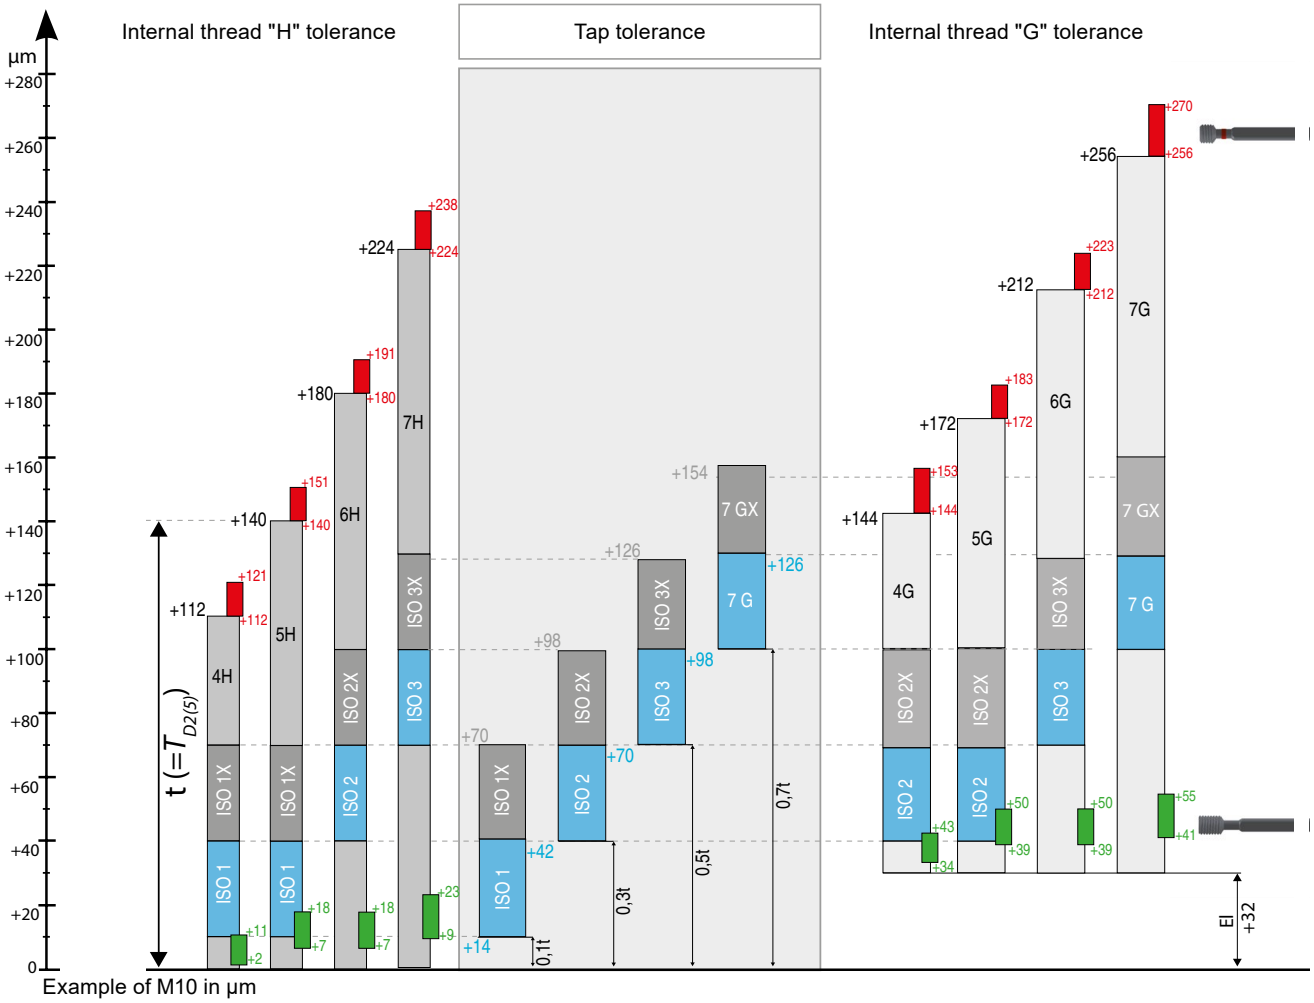
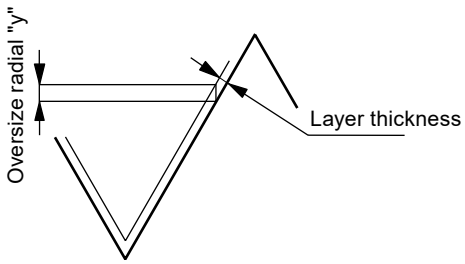
Thread tolerances and recommended manufacturing tolerances



Coated workpieces require oversize taps. The extent of oversizing is dependent on the layer thickness of the coating and the flank angle.

With

60° Flank angle	Oversize = 4 x layer thickness
55° Flank angle	Oversize = 4.331 x layer thickness
30° Flank angle	Oversize = 7.727 x layer thickness

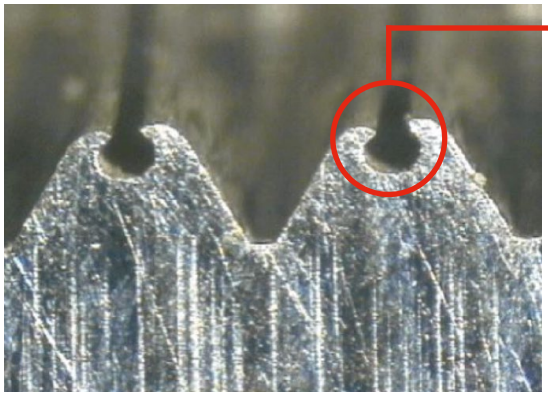


Application class of the tap Designation according to		Tolerance class of the internal thread to be cut				
DIN	ISO					
4H	ISO1	4H	5H	–	–	–
6H	ISO2	4G	5G	6H	–	–
6G	ISO3	–	(4E)	6G	7H	8H
7G	–	–	–	(6E)	7G	8G

For special applications, e.g., abrasive cast iron materials or plastics, other dimensions must be chosen that are determined based on previous experience. In such cases, an "X" is added to the short designation of the tolerance class, e.g., ISO 2X, whereby the tolerance field assignment to the internal thread may be limited (6HX for tolerance field 6H and 5G). In addition, it must be taken into account that the dimensions of the cut internal thread not only depend on the dimensions of the tap, but also on the material to be machined and all production conditions. No thread dimensions are determined for taper and intermediate taps.

Thread formers

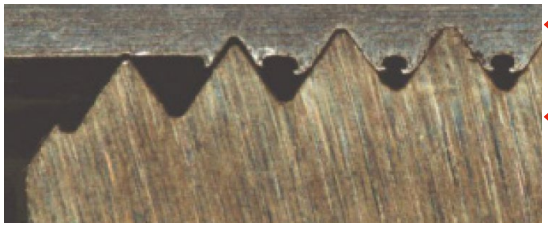
DuoForm thread former for cold-forming materials up to 1400 N/mm² or at least 5% elongation at break. The thread is produced through plastic deformation. This results in a formed thread with very high tensile strength.



Important

Before forming a thread, it is necessary to ensure that the client consents to a formed thread. In certain industries, thread forming is**not**permitted.
Dirt or bacteria can settle in the formed crest.

Incremental pressure forming



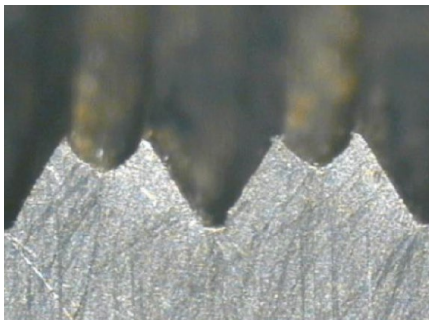
Workpiece

Thread formers

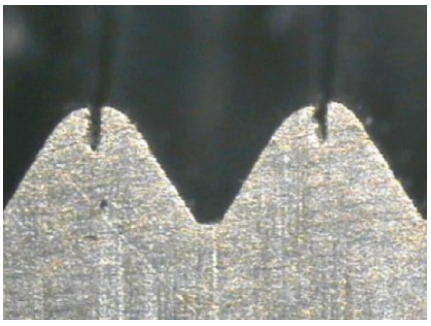
The thread profile is pressed incrementally into the material via the lead (cut) of the tap.

Characteristics

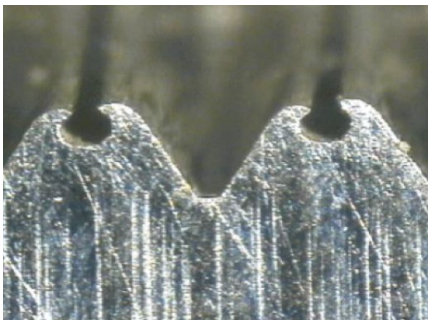
- One type can be used in different materials
- For through hole and blind hole thread
- Excellent thread surface quality
- High static and dynamic thread strength
- Secure machining of deep and deep-set threads
- Short machining times
- No chip problems
- No cutting
- High process security
- HSS-E and HSS-PM cutting material up to approximately 33 HRC with material elongation at break of at least 5%.



Underformed – core hole too large



Overformed – core hole too small



Perfectly formed – core hole correct

Troubleshooting

Poor tool life

Causes

- Overload fractures of the cutting edges on the lead
- Hardness or tool material not suitable for the application
- Pilot hole too small or work hardened
- Insufficient lubrication or incorrect application parameters

Corrective measures

- A longer lead or more flutes for the same lead length, giving a greater number of cutting teeth
- In reground tools, the hardness can be reduced; apply correct parameters for regrinding
- Increase frequency of changes or regrinding of the drilling tool
- Use the correct application parameters for the drilling tool
- Select the correct lubricant and ensure adequate supply

Axial thread error

Causes

- Selected cutting edge geometry is not suitable
- Spindle speed does not match feed (synchronization error)
- Blind hole taps are used with a feed pressure that is too high
- Through hole taps are used with a feed pressure that is too low

Corrective measures

- Check programming or master cartridge or other synchronized encoders
- Use a tapping chuck with length compensation
- Reduce feed pressure
- Increase feed pressure

Oversize thread

Causes

- Thread tolerances of tool and thread gage do not match
- Burred tool edges after regrinding
- Cold pressure welding

Corrective measures

- Use correct tolerances for tool and thread gage
- Carefully deburr
- Use appropriate (positive) geometry
- Reduce cutting speed
- Use a different surface treatment or coating
- Use a tapping chuck with length compensation
- Use appropriate lubricant

Tool breakage

Causes

- Tool is worn
- Tool has hit the bottom of the hole
- Weld deposits
- Pilot hole too small
- Chip trapping
- Incorrect cutting speed
- Chip jams in the flute
- Insufficient coolant/lubrication

Corrective measures

- Use set taps
- Use a tool with a lower helix angle
- Use tools with a shorter/longer lead
- Check the predrilling depth and thread depth
- Drill pilot hole deeper
- Correct the cutting speed
- Use a different coating or surface treatment
- Use an adapter with length compensation
- Use suitable lubricant
- Use the correct pilot hole diameter
- Change geometry and/or flute type
- Note chip shape and chip formation

Coatings

vap.
- Vaporized
- Vaporizing (steam tempering) prevents cold welding forming on the tool and increases surface hardness and therefore also wear resistance

nitr.
- Nitrided
- Nitriding increases wear resistance and gives the material good anti-friction properties

vap. + nitr.
- Vaporized + nitrided
- Combination of increased surface hardness and lubricant carrier

TiN
- TiN coating
- Maximum application temperature: 450°C or 842°F

TiN GS
- Titanium nitride anti-friction layer
- High wear resistance with good anti-friction properties
- Maximum application temperature: 450°C or 842°F

TiCN
- TiCN multilayer coating
- Maximum application temperature: 450°C or 842°F

DLC
- Diamond-like carbon coating
- Specifically for machining non-ferrous metals
- Maximum application temperature: 400°C or 752°F

Ti200
- TiN coating
- Well suited for high cutting speeds during thread forming
- Maximum application temperature: 450°C or 842°F

OSM
- Carbide and anti-friction layer
- For use with high-tensile steels

CH
- Amorphous carbon layer
- For use with non-ferrous metals and aluminum
- Reduces material adhesion

HCr
- Hard chrome plating
- For use with non-ferrous metals and aluminum
- Very low surface roughness

CrN
- Chromium-nitrogen coating
- Highly wear-resistant coating
- Specifically for use in aluminum, but also suitable for P, M, and S materials

AlTiN-HD
- AlTiN-based nanolayer hard material coating
- Maximum application temperature: 500°C or 932°F

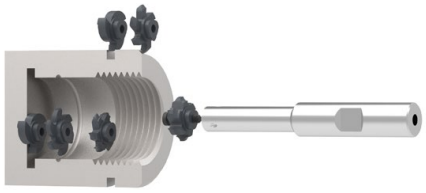
Overview of circular and thread milling cutters

Modular circular milling cutters with carbide indexable inserts

- The perfect tool for every application
- Various holders, depending on overhang
- The same threading insert for different pitches and diameters
- Highest flexibility and stability
- In addition to circular thread milling, circular and linear milling operations can also be performed.



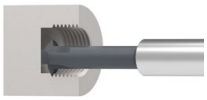
First choice for small batch sizes and large threads

Thread milling cutters with indexable carbide inserts

- Insert can be changed for different threads
- The same threading insert for different diameters

Solid carbide thread milling cutters

- Short machining times, ideal for volume production
- One tool for all thread types
- One thread milling cutter for different diameters with the same pitch



MicroMill

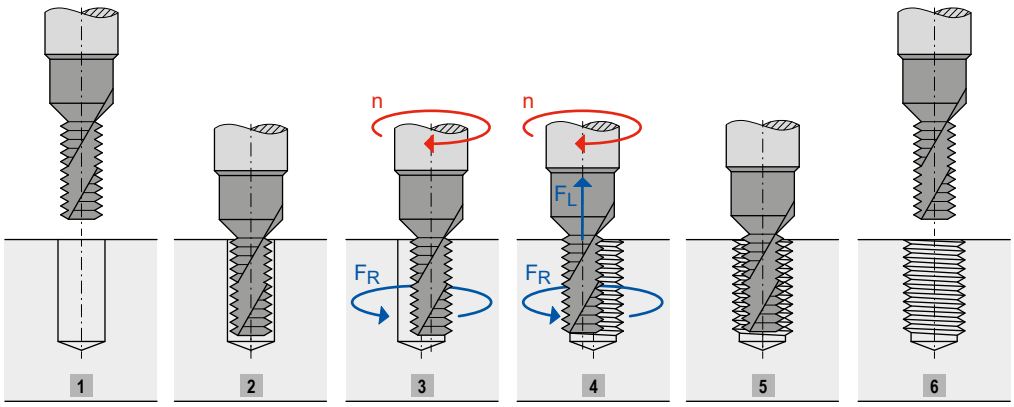
BSW	Whitworth thread
BSF	Whitworth fine thread
NPT	American taper pipe thread
Pg	Steel conduit thread
Tr	Trapezoidal thread

Thread milling process description

Cutting thread production by circular milling in the pitch (helical interpolation) with lower torque than taps and thread formers (no reversing of the spindle necessary). Thread machining to the bottom of the hole possible and high-speed cutting (HSC) can be performed.

Thread milling



Climb milling is shown here.

→ Here you will find further information on the milling processes (climb and conventional milling).

Advantages of thread milling

- Different tolerances can be produced with one tool
- One tool for blind hole and through hole machining
- Outstanding workpiece surfaces and dimensional accuracy guaranteed
- One tool for right and left-hand threads
- Low cutting pressure when machining thin-walled parts
- Precisely repeatable thread depth
- No chip issues and no chip root residues in the finished thread

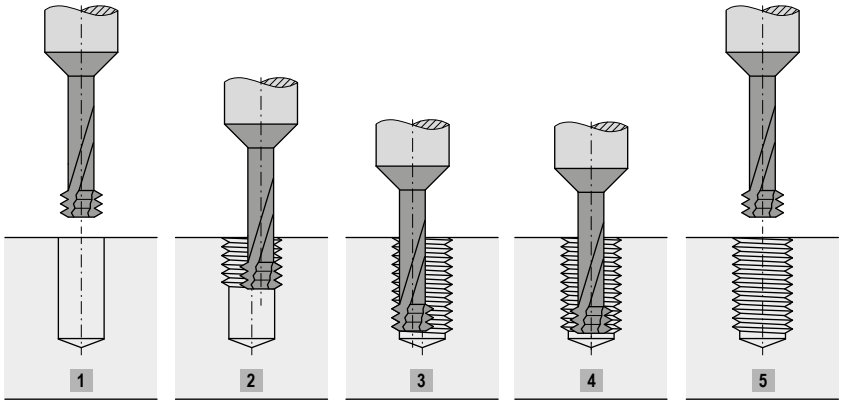
Added advantages of thread milling cutters with chamfer facet

- Savings in tool change and setup times, resulting in significantly shorter machining times
- Optimization of magazine assignment in the machine

Process

1. Positioning above the bore
2. Entry to start position for thread milling
3. Circular approach (milling) in inward circular grinding (90°/180°) at 1/4 pitch
4. 1× pitch in "Z+" direction
5. Outward circular grinding in the center of the hole (90°/180°)
6. Exit to start position

Circular thread milling



Advantages

- Different tolerances can be produced with one tool
- Outstanding workpiece surfaces and dimensional accuracy guaranteed
- One tool for blind hole and through hole machining
- Precisely repeatable thread depth
- Optimum chip removal and no chip root residues in the finished thread

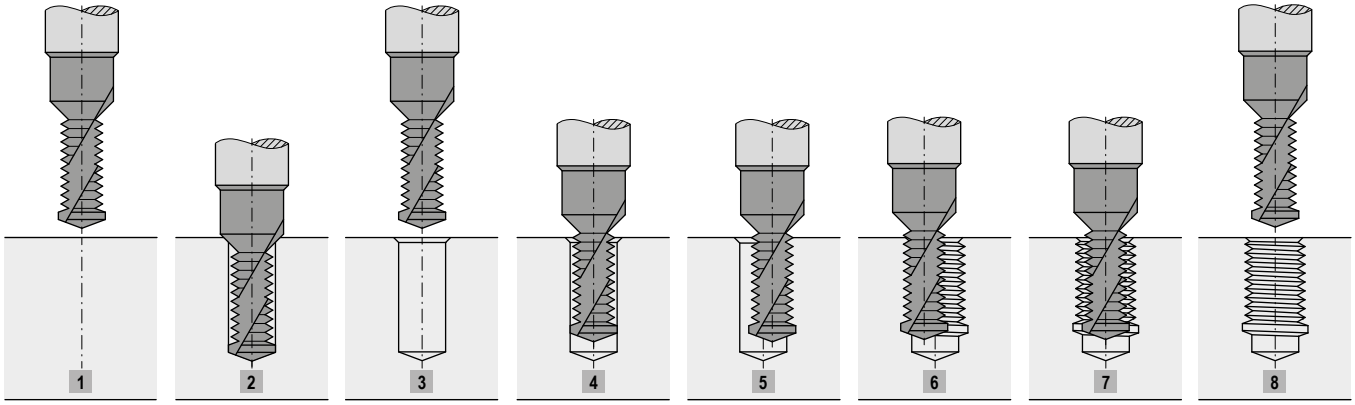
Process

1. Positioning above the bore
2. Circular drill thread milling in helical motion to the
3. required thread depth
4. Outward circular grinding in the center of the hole (90°/180°)
5. Exit to start position

Drill thread milling process description

Cutting production of a complete thread—drilling, countersinking, and thread milling with just one tool. Prerequisite: CNC-controlled milling machine or machining center with the helical interpolation function.

Drill thread milling



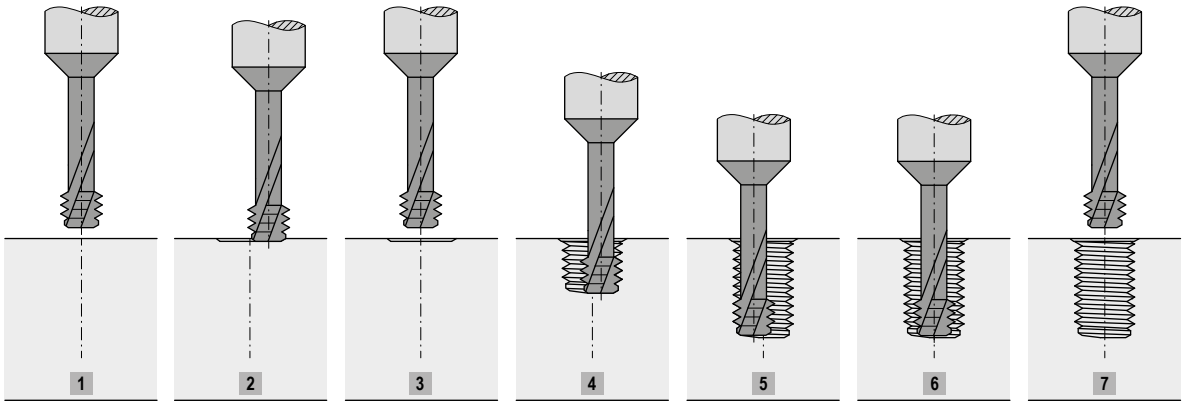
Advantages

- Shortest machining times thanks to high cutting speeds and feeds
- Savings in tool change and setup times, resulting in significantly shorter machining times
- Optimization of magazine assignment in the machine
- Different tolerances can be produced with one tool
- Outstanding workpiece surfaces and dimensional accuracy guaranteed
- One tool for blind hole and through hole machining
- Precisely repeatable thread depth
- No chip issues and no chip root residues in the finished thread
- High-speed cutting (HSC) can be performed

Process

1. Positioning above the workpiece
2. Tapping, drilling, countersinking
3. Chip removal
4. Entry to start position for thread milling
5. Circular approach (milling) in inward circular grinding (90°/180°) at 1/4 pitch
6. 1× pitch in "Z+" direction
7. Outward circular grinding in the center of the hole (90°/180°)
8. Exit to start position

Circular drill thread milling



Advantages

- Shortest machining times due to simultaneous creation of the tap hole and thread
- Savings in tool change and setup times, resulting in significantly shorter machining times
- Optimization of magazine assignment in the machine
- Different tolerances can be produced with one tool
- Outstanding workpiece surfaces and dimensional accuracy guaranteed
- One tool for blind hole and through hole machining
- Precisely repeatable thread depth
- Optimum chip removal and no chip root residues in the finished thread

Process

1. Positioning above the workpiece
2. Chamfering (until countersinking depth is reached)
3. Return to the start position above the component
4. Circular drill thread milling in helical motion to the
5. required thread depth
6. Outward circular grinding in the center of the hole (90°/180°)
7. Exit to start position

When calculating the feed for circular milling, check whether machining is taking place with the contour feed v_f or center path feed v_{fm}.

Note! Threading inserts are marked R (right-hand thread) and L (left-hand thread). The standard tool holder cannot be used to produce a left-hand thread! Tool holder for left-hand thread available on special request.

The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material and type of machine. The specified values represent guideline cutting data that can be adjusted by approximately **±20%** according to the usage conditions.

O.3.1	130	0,04	0,1

The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material and type of machine. The specified values represent guideline cutting data that can be adjusted by approximately **±20%** according to the usage conditions.

The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material and type of machine. The specified values represent guideline cutting data that can be adjusted by approximately **±20%** according to the usage conditions.

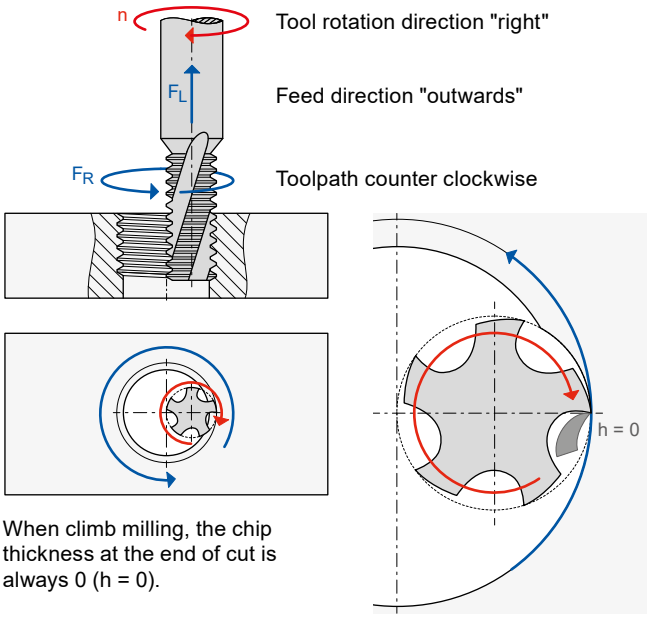
Milling processes

Climb milling

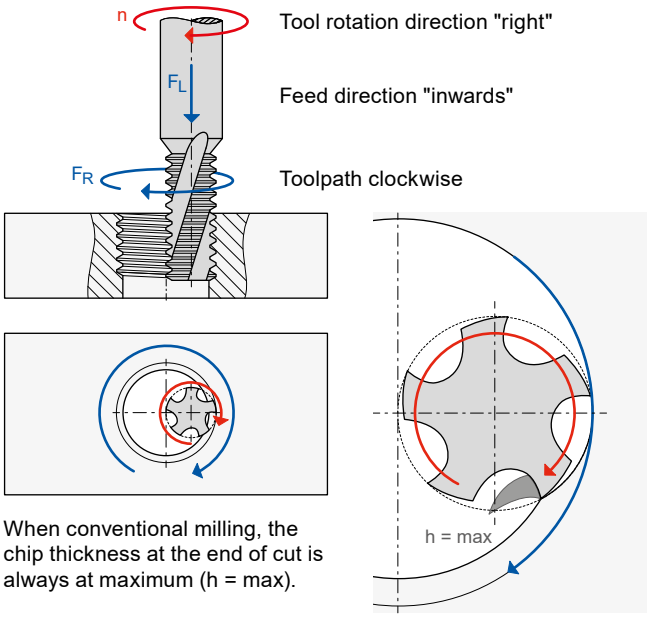
Right-hand thread



When climb milling, the chip thickness at the end of cut is always 0 (h = 0).

Conventional milling

Right-hand thread



When conventional milling, the chip thickness at the end of cut is always at maximum (h = max).

Correction values for the internal thread milling

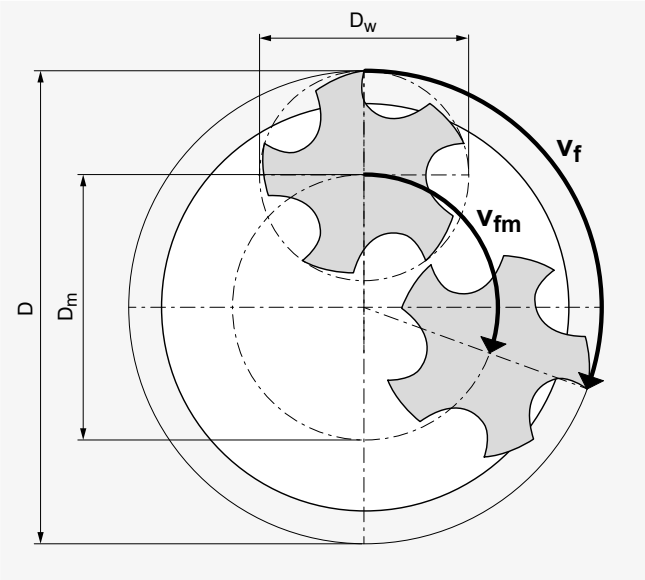
The milling radius correction, which is entered into the machine control, can be calculated as follows:

Half the cutter Ø – (0.05 × pitch P)

Example: M30×3	Cutter Ø: 20mm	$\frac{Ø20}{2} - (0{,}05 \times 3) = \underline{9{,}85\ mm}$	**9.85 mm is the milling radius to be entered into the machine control!**

Calculation of cutting data for thread milling

Feed calculation



Peripheral feed rate (v_f)

$$v_f = n \times f_z \times z \quad \text{mm/min.}$$

Centerline feed rate v_{fm}

$$v_{fm} = \frac{v_f \times (D - D_w)}{D} \quad \text{mm/min.}$$

D_w = Effective diameter in mm
n = RPM in min^{-1}
f_z = Feed per tooth in mm
z = Number of cutting edges (radial)
D = Nominal thread diameter = external profile diameter in mm
D_m = Center path diameter ($D - D_w$) in mm

Tips for the user

When thread milling, there are two different ways of programming the tool feed:

One is where the machine controls the feed at the diameter of the tool, the other controls the feed at the tool center line.
In order to ascertain which method the machine control uses, the following method should be employed:

- Enter the thread milling program into the control
- Enter a safety margin into the program, so that the thread program runs without contacting the workpiece
- Run the program and check the machining time taken
- Compare the actual time with the calculated theoretical time

If the time is longer than the calculated time, use the tool center feed.
If the time is shorter than the calculated time, use the diameter feed.

$$n = \frac{v_c \times 1000}{d \times \pi}$$

$$n = \frac{v_f}{f_z \times z}$$

$$v_c = \frac{d \times \pi \times n}{1000}$$

$$v_f = n \times f_z \times z$$

$$f_z = \frac{v_f}{z \times n}$$

n	rev./min.	=	Spindle rotation speed
v_c	m/min	=	Cutting speed
d	mm	=	Tool diameter
D	mm	=	Nominal thread Ø
v_f	mm/min.	=	Feed rate at the diameter
v_{fm}	mm/min.	=	Feed rate at the center
U_{arc}	mm/min.	=	Programmed ramping feed rate
f_z	mm	=	Feed per tooth
z	Piece	=	Number of cutting edges of the cutter

Milling – external contour

$$v_{fm} = \frac{v_f \times (D + d)}{D}$$

$$v_f = \frac{D \times v_{fm}}{(D + d)}$$

Milling – internal contour

$$v_{fm} = \frac{v_f \times (D - d)}{D}$$

$$v_f = \frac{D \times v_{fm}}{(D - d)}$$

Helical plunging

$$U_{arc} = 0{,}25 \times v_{fm}$$

Ramping in the arc

$$U_{arc} = v_{fm}$$

Coatings

AlCrN
- High-performance AlCrN multilayer coating
- Max. application temperature: > 1100 °C

CWX 500
- Carbide, TiAlN-coated
- The universal carbide grade for almost all materials

TiAlN
- TiAlN multilayer coating
- Maximum application temperature: 900 °C

TiCN
- TiCN multilayer coating
- Maximum application temperature: 450 °C

TiN
- TiN coating
- Maximum application temperature: 450 °C

Ti 500
- TiAlN coating
- Maximum application temperature: 500 °C

Ti 600
- TiAlN multilayer coating
- Maximum application temperature: 650 °C

Ti 601
- High-performance TiAlN multilayer coating
- Maximum application temperature: 900 °C

Ti 602
- TiCN multilayer coating
- Maximum application temperature: 400 °C

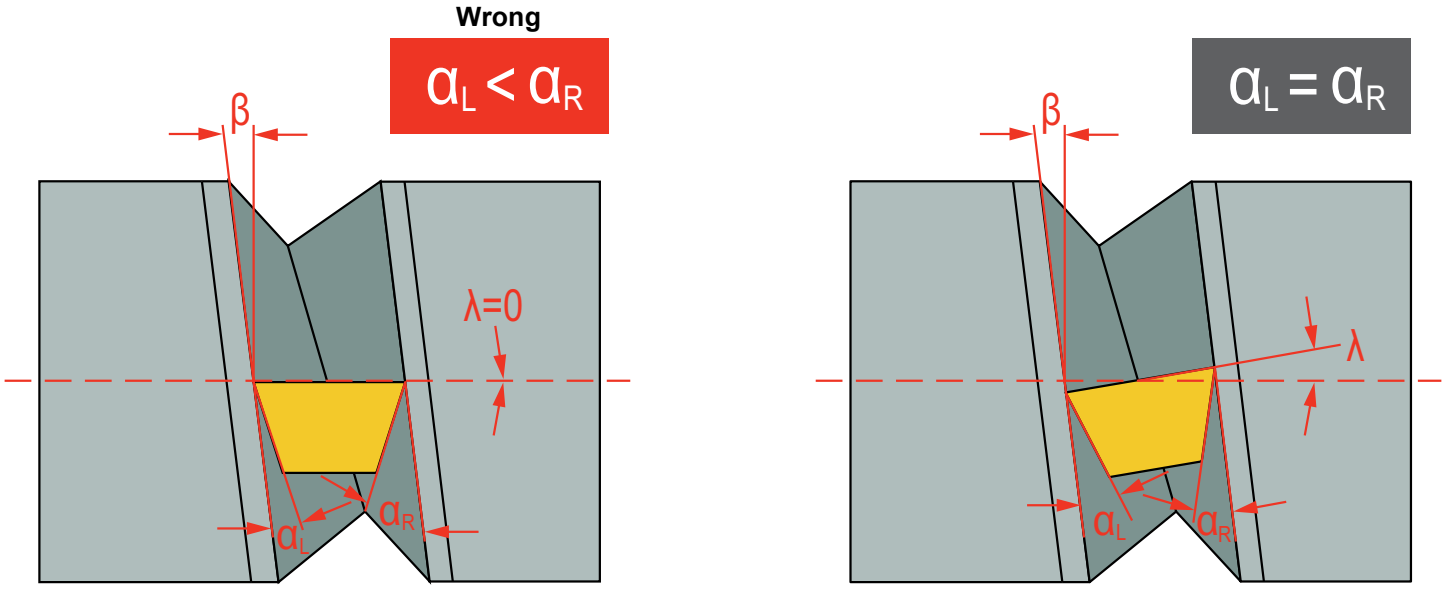
1) Neutral version for tool holder marked (U).

Flank clearance angle and effective approach angle

The angle of inclination λ of the cutting edges, in concert with the thread approach angle β ensures an equal rake angle and side clearance angle on both thread flanks.



α = Side clearance angle
λ = Approach angle
β = An effective angle of inclination is achieved by using a suitable insert seat

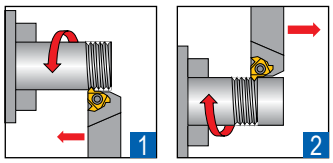
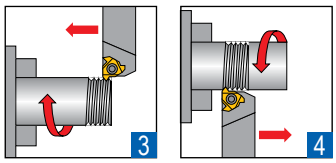
The cutting data is strongly influenced by external conditions, such as the stability of the tool and workpiece clamping, material, and type of machine. The specified values represent guideline cutting data that must be corrected according to the usage conditions.

Thread turning methods

External right-hand thread

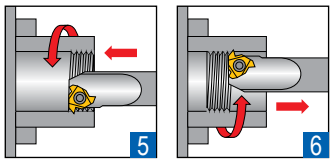


External left-hand thread

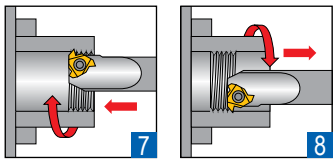


The machining examples 2, 4, 6, and 8 require negative shims.

Internal right-hand thread

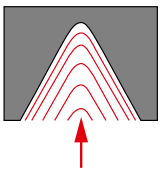


Internal left-hand thread



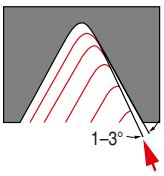
Thread infeed methods

Radial infeed



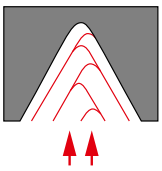
- For pitches less than 1.5 mm
- For short-chipping materials
- For machining hardened materials
- Quick and simple infeed method

Flank infeed



- For pitches greater than 1.5 mm
- With radial infeed, the effective cutting edge length is too long, which can lead to chatter
- With TRAPEZ and ACME, machining on three flanks is disadvantageous for chip flow

Alternating infeed



- For larger pitches
- For long-chipping materials
- Uniform wear of the cutting edges
- Complicated programming process required

Approach angle

Important information about standard shims

- The approach angle should always be determined by means of a calculation or using the diagram below.
- The threaded tool holders have a 1.5° inclined insert seat and a shim without angle correction. This means that the tool holders have an approach angle β of 1.5° when delivered.

Without the appropriate approach angle correction, the following may occur:

- The profile may become distorted.
- The indexable insert sits on top – the clearance angle is insufficient.
- The tool life of the insert is greatly reduced.

Method 1: Calculation

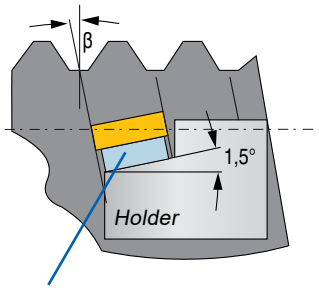
Calculation of the approach angle β:

$$\beta = \frac{20 \times TP}{DMIN}$$

For trapezium:

$$\frac{15 \times TP}{DMIN}$$

20 = constant
β = approach angle (°)
TP = pitch (mm)
DMIN = nominal diameter (mm)



Example calculation

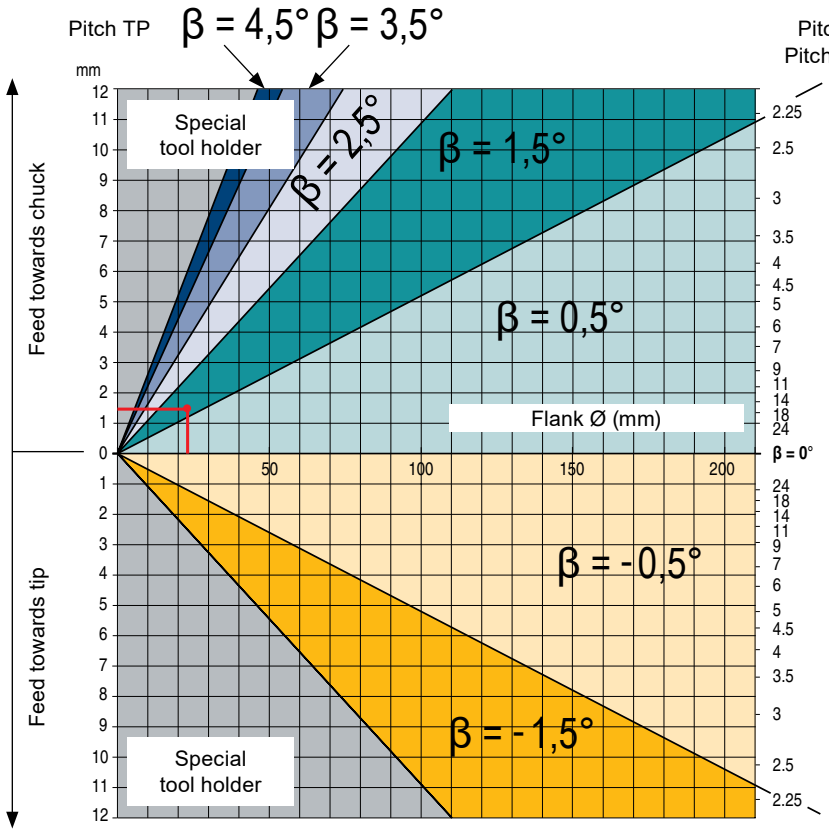
External thread M24 x 1.5
Feed towards chuck
DMIN = nominal Ø: M24 = 24 mm
TP = pitch: 1.5 mm

$$\beta = \frac{20 \times 1{,}5 \text{ mm}}{24 \text{ mm}}$$

β = 1,25°

Method 2: Diagram

A line is drawn vertically upward from the flank diameter in the diagram until it intersects with the line representing the pitch of the thread to be produced. In the color-coded region where you are currently located, the corresponding factor is displayed at the edge of the diagram.



Calculated approach angle β value	Correction angle α
0,0°–0,49°	-1,5°
0,5°–0,99°	-1°
1,0°–1,99°	0°
2,0°–2,99°	+1°
3,0°–3,99°	+2°
4,0°–4,99°	+3°
0,0°–(-0,49°)	-2°
-0,5°–(-1,5°)	-3°

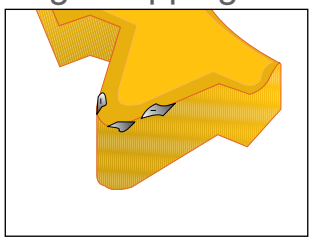
Troubleshooting

Edge chipping



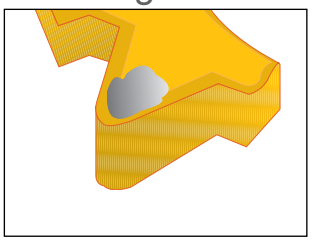
Causes

- Frequently occurs with stainless workpiece materials
- Incorrect carbide grade

Corrective measures

- Avoid tool overhang
- Check whether the threading insert is correctly clamped
- Avoid vibrations
- Use a tougher carbide quality

Cratering



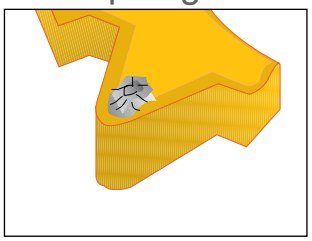
Causes

- Frequently occurs with stainless workpiece materials
- Cutting speed too high
- Incorrect carbide grade

Corrective measures

- Apply coolant
- Reduce cutting depth
- Use a harder carbide quality

Built-up edge



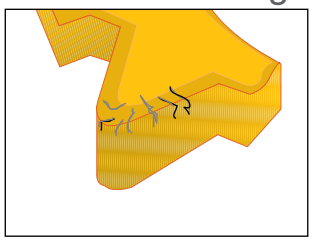
Causes

- Cutting speed too low
- Incorrect carbide grade

Corrective measures

- Apply coolant
- Increase cutting speed
- Use a tougher carbide quality

Thermal cracking



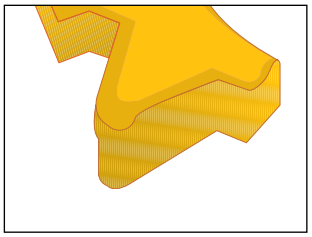
Causes

- Insufficient coolant
- Cutting speed too high
- Incorrect carbide grade

Corrective measures

- Apply coolant
- Keep cutting speed to a minimum
- Use a tougher carbide quality

Deformation



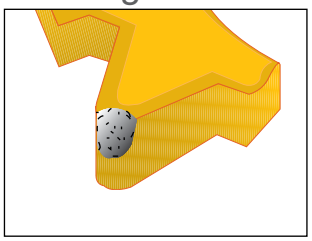
Causes

- Infeed too great
- Insufficient coolant
- Cutting speed too high
- Incorrect carbide grade

Corrective measures

- Apply coolant
- Reduce cutting depth
- Keep cutting speed to a minimum
- Use a harder carbide quality

Breakage



Causes

- Infeed too great
- Insufficient coolant
- Plastic deformation
- Unstable
- Incorrect approach angle
- Incorrect carbide grade

Corrective measures

- Reduce cutting depth
- Check machine and tool stability
- Reduce cutting speed
- Observe the approach angle
- Use a tougher carbide quality

Grade description

Steel

CTPP525

- Carbide PVD TiAlN-coated
- ISO | **P25** | M15 | **K25** | **S20** | H25
- PVD-coated carbide grade for the machining of general steels and cast iron materials at medium to high cutting speeds

Stainless steel

CTPM520

- Carbide PVD TiAlN-coated
- ISO | P25 | **M20** | K25 | N20 | S25 | H25
- PVD-coated carbide grade for the machining of stainless steels at medium to high cutting speeds

Non-ferrous metals

CTWN520

- Carbide, uncoated
- ISO | **N20** | S20
- Uncoated carbide grade for machining non-ferrous metals and, to a limited extent, heat-resistant alloys

Universal

CTPX525

- Carbide, PVD TiN-coated
- ISO | **P25** | M20 | **K25** | S25 | H25
- Universal carbide grade for a wide variety of materials at low cutting speeds

Profile information

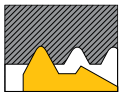
Full profile

- Core diameter does not have to be machined to the finished core diameter
- A minimum infeed of 0.07 mm is required
- Insert can only be used for one pitch

Advantages:

- High-quality thread
- No burr formation
- No rework
- Longer downtime in some cases.

Partial profile

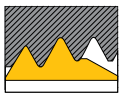


- Core diameter must be premachined to the finished size
- A minimum infeed of 0.07 mm is required

Advantages:

- One threading insert can be used to machine several pitches
- Threading insert can be used for any application
- Reduced stock requirements

Multi-tooth threading insert



- Core diameter does not have to be machined to the finished core diameter
- A minimum infeed of 0.07 mm is required
- Insert can only be used for one pitch

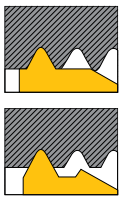
Advantages:

- Fewer passes required
- Thread production in less time

Note:

- Check there is sufficient thread run-out

Mini threading insert



- From a min. core hole diameter of Ø 6 mm or Ø 8 mm

Advantages:

- Special cutting materials for low cutting speeds
- Three cutting edges for miniature applications

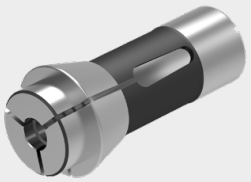
Pressure collets

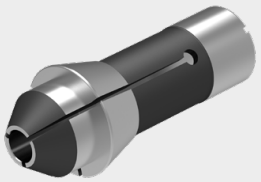
Collets for clamping the bar in the main spindle and for the sub-spindle



→

Stem collets

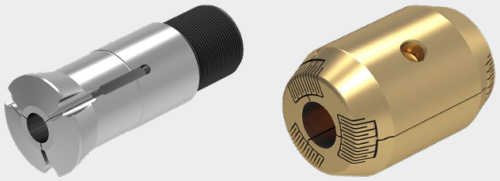
With an adapted stem for improved pick-up of the workpieces and for better secondary operation machinability



→

Guide bushes

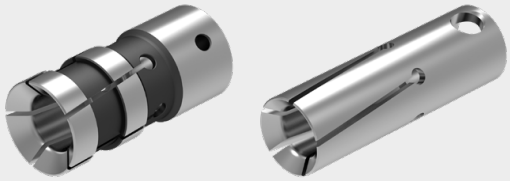
Ensures bar guidance in the main spindle



→

Clamping sleeves

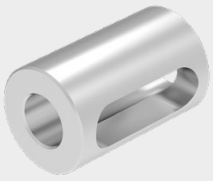
Mounting for bar feeder magazines



→

Reduction sleeves

With a reduction sleeve, small tools can be used directly on tool clamping points with larger mounting diameters.



→

CoreLine – ER precision collet chucks – Centro-P

- For standard or sealing disc lock nuts
- Maximum clamping range covered according to ISO tolerance field H10
- Roll key required for clamping
- p_{max} = 80 bar
- **By request:** Also available with Balluff chip

Scope of supply:
Base body **without** lock nut, **without** stop screw

HyPower – Compensation holder – DAH

- Tried-and-tested hydraulic expansion clamping technology
- Maximum radial run-out accuracy and repeatability < 1 µ ensures consistent cutting action
- Very simple run-out adjustment
- Compact design
- Unbeatable vibration damping, meaning outstanding surface quality
- Flexible clamping range with reduction sleeves
- Speeds of up to 25,000 rpm
- Suitable for minimum quantity lubrication (MMS)

HyPower – Actively vibration-damped shell mill adapter

- The specially mounted damping core enables perfect machining results even with longer tool overhangs
- Reduction in machining times due to optimum machining parameters
- Damped machining and therefore perfect surface qualities
- Protection of the machine spindle and increased tool life
- Screwed in drive keys
- **By request:** Also available with Balluff chip

Scope of supply:
Base body with retaining screw and drive key

HyPower – Compensation holder – DAH

- Tried-and-tested hydraulic expansion clamping technology
- Maximum radial run-out accuracy and repeatability < 1 µ ensures consistent cutting action
- Very simple run-out adjustment
- Compact design
- Unbeatable vibration damping, meaning outstanding surface quality
- Flexible clamping range with reduction sleeves
- Speeds of up to 25,000 rpm
- Suitable for minimum quantity lubrication (MMS)

HyPower – Actively vibration-damped shell mill adapter

- The specially mounted damping core enables perfect machining results even with longer tool overhangs
- Reduction in machining times due to optimum machining parameters
- Damped machining and therefore perfect surface qualities
- Protection of the machine spindle and increased tool life
- Screwed in drive keys
- **By request:** Also available with Balluff chip

Scope of supply:
Base body with retaining screw and drive key

HyPower – Compensation holder – DAH

- Tried-and-tested hydraulic expansion clamping technology
- Maximum radial run-out accuracy and repeatability < 1 µ ensures consistent cutting action
- Very simple run-out adjustment
- Compact design
- Unbeatable vibration damping, meaning outstanding surface quality
- Flexible clamping range with reduction sleeves
- Speeds of up to 25,000 rpm
- Suitable for minimum quantity lubrication (MMS)

CoreLine – ER precision collet chucks – PCC

- For standard or sealing disc lock nuts
- Maximum clamping range covered according to ISO tolerance field H10
- Roll key required for clamping
- p_{max} = 100 bar
- **By request:** Also available with Balluff chip

Scope of supply:
Base body with lock nut and stop screws

G 2.5 $n_{max.}$25000

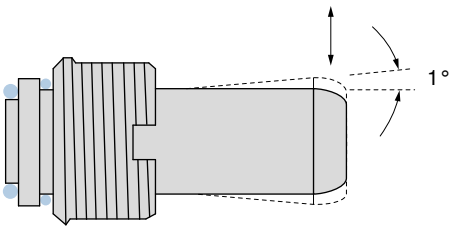
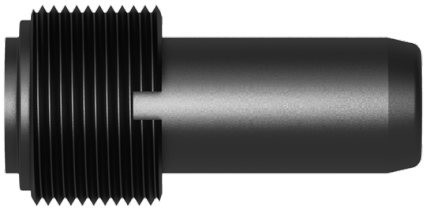
Coolant pipe – HSK

▲ Can be used up to 100 bar

Scope of supply:
Complete, including sealing rings



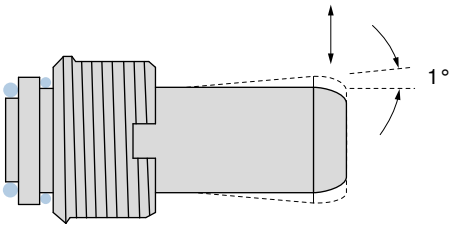


Adapter	THOD	CT 83 760 ...
HSK 32	M10 x 1	032
HSK 40	M12 x 1	040
HSK 50	M16 x 1	050
HSK 63	M18 x 1	063
HSK 80	M20 x 1,5	080
HSK 100	M24 x 1,5	100

Coolant transfer pipe with strainer – HSK

▲ 75 µ filter screen can be used up to 80 bar

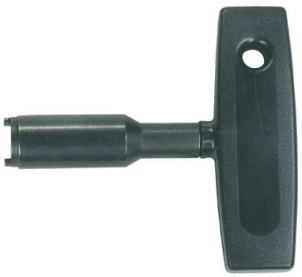
Scope of supply:
Complete, including sealing rings and filter screen



Adapter	THOD	CT 83 760 ...
HSK 63	M18 x 1	16300
HSK 100	M24 x 1,5	20000

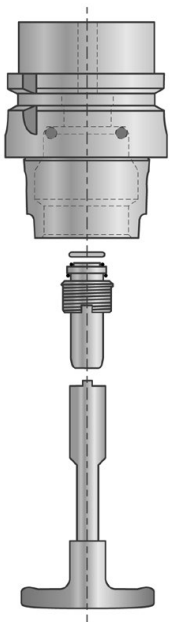
For usage with micro tools with thru coolant, improved tool life due to reduced contamination of the coolant hole.

Key – HSK

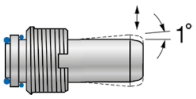


Adapter	CT 83 758 ...
HSK 32	032
HSK 40	040
HSK 50	050
HSK 63	063
HSK 80	080
HSK 100	100

Coolant pipe for HSK tools



The coolant pipe is ideally mounted in the vertical direction – from the bottom to the top. In this manner, the sealing ring is prevented from being displaced or compressed during locating, which would cause the loss of its sealing function. After mounting, the coolant pipe can be moved only to a minimum degree according to DIN (± 1°).

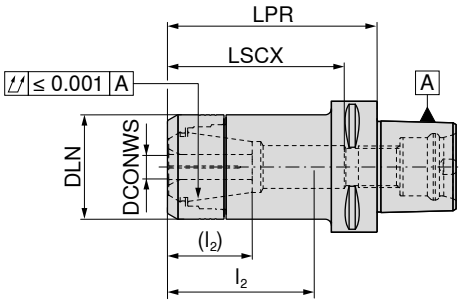


Flexibility

CoreLine – ER precision collet chucks – Centro-P

- For standard or sealing disc lock nuts
- Maximum clamping range covered according to ISO tolerance field H10
- Roll key required for clamping
- p_{max} = 80 bar
- **By request:** Also available with Balluff chip

Scope of supply:
Base body **without** lock nut, **without** stop screw



G 2.5 $n_{max.}$25000

HyPower – Damping element – ABS

- The specially mounted damping core enables perfect machining results even with longer tool overhangs
- Reduction in machining times due to optimum machining parameters
- Damped machining and therefore perfect surface qualities
- Protection of the machine spindle and increased tool service life

HyPower – Compensation holder – DAH

- Compensation systems for µ-precision run-out
- Simple correction of run-out and axis errors
- Optimized for high rpm
- Designed for internal coolant supply
- Rotary tools provide long tool life

Scope of supply:
DAH compensation holder complete with assembly screws

CoreLine – Bar pullers for star turrets

- Two adjustable, spring-mounted, replaceable grippers are fitted to the base body. Each of these is equipped with a carbide insert. The grippers are set to a slightly smaller diameter than the bar and then pressed onto the bar in an axial direction (x axis) by the tool turret.
- 90° angle head
- GA = Gripper set

Scope of supply:
Bar puller with GA 3

CoreLine – Hydraulic chuck

- Hydraulic chuck with cylindrical shank
- For the hydraulic clamping of cylindrical tool shanks tol. h6, boring bars, and cylindrical tool holders tol. h7, g6 in fixed base holders
- One screw for locking the boring bar
- With length setting screw – can also be removed to enable the boring bar to be slid through
- High-precision clamping with a repeatability of 3 µm

Scope of supply:
Base body with stop screw and pressure screw

MultiChange – Program Overview

The "MultiChange" exchangeable head system enables an extremely fast and problem-free tool change. Provides maximum changeover and radial run-out accuracy with maximum stability at the same time. The following chapters contain suitable exchangeable heads for a multitude of applications.

Exchangeable heads

→ Solid carbide drills

Solid carbide NC spot drills

Ø 8, 10, 12, 16, 20 mm
NOF 2

SIG 90°

SIG 120°

SIG 142°

→ Reamers and countersinks

Exchangeable reaming heads

Ø 8,00 – 30,20 mm

Through hole

Ø 12,20 – 30,20 mm

Blind hole

→ Solid carbide milling cutters

Solid carbide shoulder mills
Ø 8, 10, 12, 16, 20 mm /
ZEFP 3+4

Type PCR UNI

Type PCR ALU

Type N

Solid carbide torus cutters
Ø 8, 10, 12, 16, 20 mm / ZEFP 3+4

Type W

Type N

Solid carbide roughing-finishing milling cutters
Ø 8, 10, 12, 16, 20 mm / ZEFP 4+6

Type NF

Solid carbide finish milling cutters
Ø 8, 10, 12, 16, 20 mm / ZEFP 6

Type N

Solid carbide ball-nosed end mills
Ø 10, 12, 16, 20 mm / ZEFP 4

Type N

Solid carbide high-feed cutters
Ø 8, 10, 12, 16, 20 mm / ZEFP 6

Type N

Solid carbide quarter round cutters
Ø 8, 10, 12, 16, 20 mm / ZEFP 6

Type N

Solid carbide deburring cutters
Ø 10, 12, 16, 20 mm / ZEFP 4+6

Type N

Type N

NOF / ZEFP = Number of cutting edges

Holders

→ Adapters and accessories

OAL 60 – 90 mm

Conical 87° / steel

Cylindrical* / steel

OAL 85 – 120 mm

Conical 87° / steel

Cylindrical* / steel

Conical 87° / solid carbide

Cylindrical* / solid carbide

OAL 110 – 150 mm

Conical 87° / solid carbide

Cylindrical* / solid carbide

OAL 150 – 200 mm

Conical 87° / solid carbide

Cylindrical* / steel

Cylindrical* / solid carbide

OAL 200 – 250 mm

Cylindrical* / steel

Cylindrical* / solid carbide

* Only suitable for milling to a certain degree

CoreLine – Holders – MultiChange

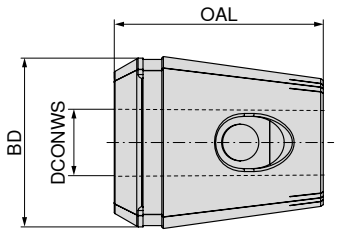
ER wedge collet with pull out protection, for precision collet chucks

- Similar to DIN ISO 15488-A
- Slotted
- Double taper collet

ER
5 µm



BD = 32.7
OAL = 40
ER 32

16	CP 32	455

Precision tap collet, shape ET (ER) with length compensation

- DIN ISO 15488 (alt DIN 6499)
- With length compensation under tension (LTENS)
- The spring force is adapted to the thread size
- Anti-rotation by 2 and/or 4 clamping screws on the shank square drive

ER
10 µm

14.0					140
16.0					160

Length compensation only possible under tension. When using CNC machines apply canned cycles with a feed rate or pitch of only 95% with small threads and up to 99% with large threads. In this way when reversing the rotation of the spindle an optimum length compensation in both directions is guaranteed.

Sealing discs for precision collet chucks – Centro-P, ER-Standard and ER-Mini with thru coolant

- For sealing when using tools with internal cooling
- Sealing range: nominal diameter -0.1 mm / +0.4 mm
- Can be applied up to 80 bar

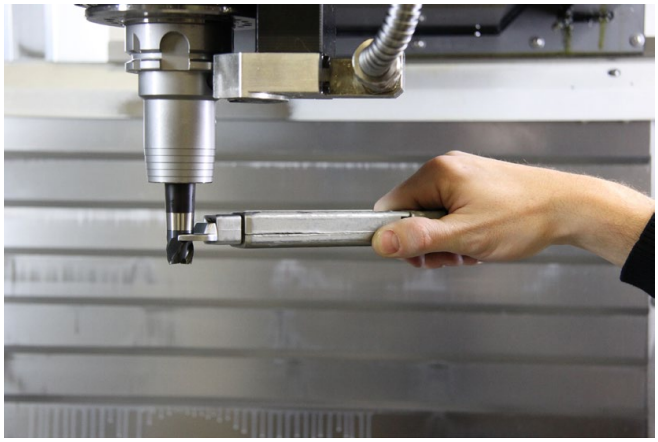
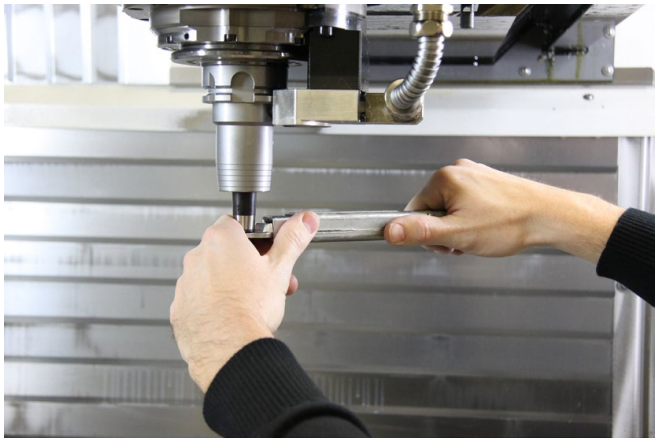
Assembly instructions for MultiChange heads

- Clean the taper, thread, and face of the milling head.
- Clean the taper, thread, and face of the holder.
- Screw the milling head clockwise into the holder by hand (exercise caution and use gloves if necessary).
- Tighten the exchangeable milling head to the specified tightening torque using the torque key and the correct spanner (according to the table).
- The gap between the head and holder must be closed (force-fit and form-fit connection).



The torque key must be horizontally aligned with the key face; take care not to tilt the key face.



Additionally placing a hand on the exchangeable milling head is important for sensitive alignment. This helps to ensure the torque can be better maintained.

CoreLine – Universal 3D tester

- Fast and accurate positioning at reference edges
- For locating and/or setting the zero point of the workpiece
- With adjustable radial run-out accuracy
- Can be used in all 3 axes (x, y, z)
- For all NC and erosion machines (insulation between stylus and case)
- Reading of actual dimensions is independent of direction
- Reading precision 0.01 mm

Scope of supply:
3D tester including short stylus and Allen key

	CT
Universal 3D tester	85 290 ...
	100

CoreLine – Zero height setting gage

- To determine the point of reference and/or for adjusting tools "to zero"
- Plate Ø 10 mm
- Plate is hardened, non-magnetic

CoreLine – Digital 3D tester

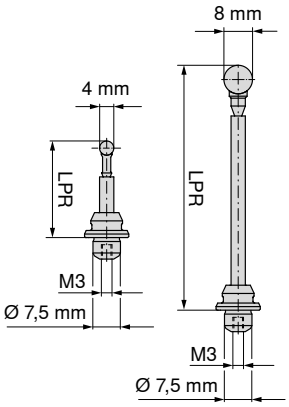
- Fast and accurate positioning at reference edges
- For locating and/or setting the zero point of the workpiece
- With adjustable radial run-out accuracy
- Can be used in all 3 axes (x, y, z)
- For all NC and erosion machines (insulation between stylus and case)
- Reading of actual dimensions is independent of direction
- Reading precision 0.001 mm

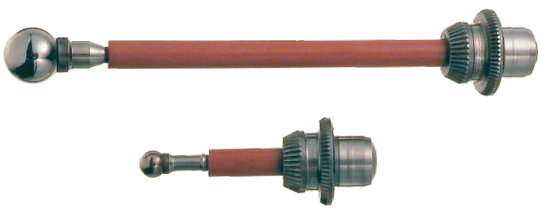
Scope of supply:
3D tester including short stylus and Allen key

	CT
	85 291 ...
Digital 3D tester	100

Stylus for 3D tester

- With movement of 2 mm beyond the zero point, a break-off ceramic insert prevents damage to the unit
- If the stylus is broken, remove and insert a new stylus
- Check radial run-out accuracy and adjust if necessary





LPR mm	CT 85 290 ...
25	102
65	104

CoreLine – Universal 3D tester HQ

- Fast and accurate positioning at reference edges
- Development of the existing universal 3D tester
- Improved mechanics
- Compact size
- Characterized by over travel safety
- Functionality as with 85 290 100
- Reading precision 0.01 mm

Scope of supply:
3D tester including short stylus and Allen key

	CT
Universal 3D tester HQ	85 292 ...
	100

CoreLine – Universal 3D tester Mini

- Fast and accurate positioning at reference edges
- Very small universal 3D tester
- Particularly suitable for machines with small spindle taper e.g., SK 30 or HSK 32
- Low overhang length thanks to short housing
- Characterized by over travel safety
- Functionality as with 85 290 100
- Reading precision 0.01 mm

Scope of supply:
3D tester including short stylus and Allen key

	CT
Universal 3D tester Mini	85 295 ...
	100

Center finder

- Centralize holes and shafts quickly and accurately
- Simple operation
- Dial gage remains in the operator's vision during process
- Centering accuracy 0.003 mm

Scope of supply:
3D tester incl. straight stylus and telescopic rod

	CT
	85 299 ...
Center finder	100

Measuring range with stylus Ø 5 mm:
holes Ø 6–125 mm, shafts Ø 0–125 mm

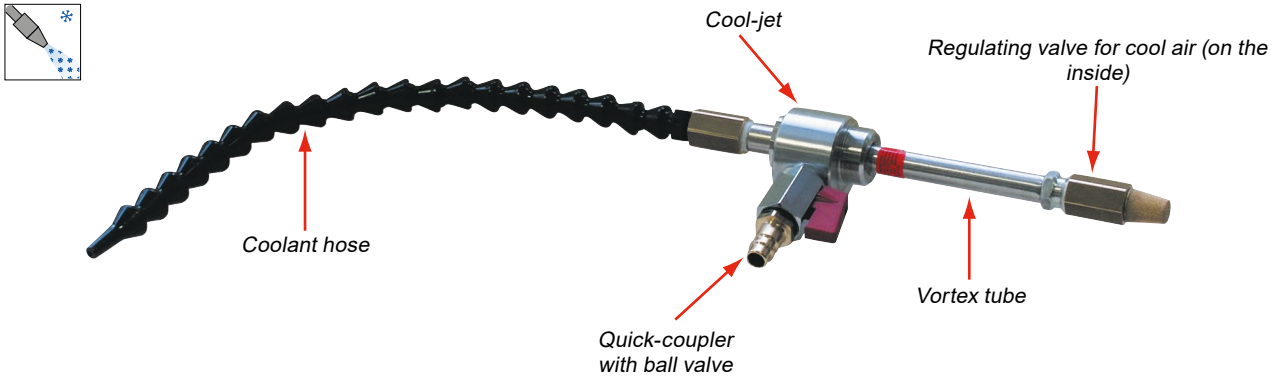
Advantages of using the cold air nozzle

The main advantages are that cooling agent disposal is not required and tool life increases by up to 100% when dry machining.

In order to improve the service life when dry machining, we recommend the use of our cooling nozzle, which can be used with a normal compressed air connection from a pressure of 6 bar.

It not only helps to **cool the tool and the workpiece**, but its main purpose is **chip removal** to prevent **chip jams**.



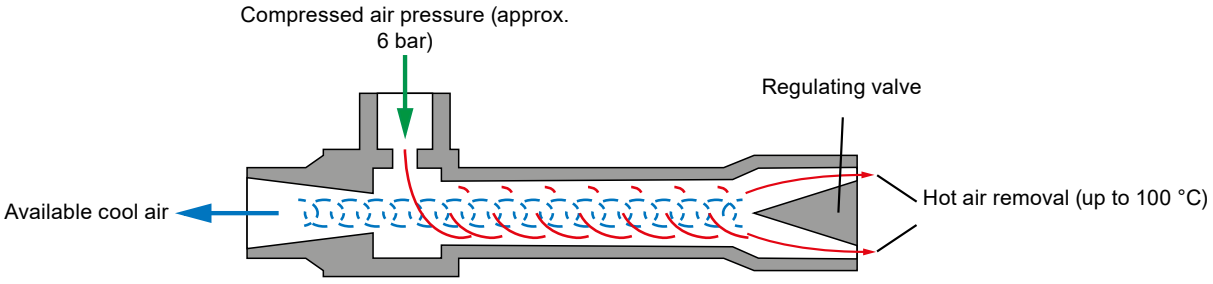
Cool-jet	CT 81 900 ...
3…7 bar air pressure, at -46 °C	100

Accessories	CT 81 900 ...
Magnetic plate Ø 80 mm without clamping arm	101
Spare tube, length 300 mm	104
Jet silencer (air filter)	105
Clamping arm, length 75 mm	106
Complete set (with magnetic plate and clamping arm), weight 0.4 kg	107

Technical description – Operating instructions

The principle of the cold air nozzle is based on the use of vortex tubes. Ordinary air is divided into cold and hot air streams.

Without any additional power supply or moving parts, the cold air nozzle can deliver a **cooling performance of up to 733 W** and create **temperatures of approx. -42 °C** and it just requires operating pressure air of approx. 6 bar.
A water trap or service unit should be installed upstream of the cold air nozzle. A regulating valve in the hot air outlet regulates the temperatures and currents.



Utilizable air temperature measured at the effective discharge of the vortex tube (not the nozzle end)

Inlet pressure				
	3 bar	-31 °C	up to	-6 °C
	4 bar	-35 °C	up to	-8 °C
	5 bar	-39 °C	up to	-10 °C
	6 bar	-42 °C	up to	-11 °C
	7 bar	-46 °C	up to	-13 °C

Air consumption at an inlet temperature of +21 °C and an inlet pressure of 6.9 bar: 7.08 l/sec. (25.5 m³/h)

The silencer must be unscrewed in order to operate the regulating valve and there is a risk of burns when doing this. The vortex tube on the hot air side can reach up to 100 °C, so allow it to cool before touching it.

Driven tools

CERATIZIT offers a comprehensive portfolio of driven tool holders for the turrets or machines of leading manufacturers. There is almost no limit to the range of types available. You will find a small selection of our holders here.

Examples from our driven tooling range

Axial drilling and milling head

Radial drilling and milling head

Rear offset radial drilling and milling head

Double radial drilling and milling head

Double axial drilling and milling head

Offset axial drilling and milling head

Swivel head

Modular milling

Summary of machine turret manufacturers and interfaces for which CERATIZIT can supply driven tools

- Sauter
- Baruffaldi
- Duplomatic
- DIN1809
- DIN5480
- DIN5482
- Baruffaldi Toem
- Bevel gear milling
- Spline / tooth milling
- BMT (bolt on)

Technical advice

Are you interested in our driven tools? If so, please contact your technical sales engineer, who will be glad to assist you. Alternatively, you can contact our office-based internal technical sales engineers, who can be reached on our freephone number.

Inquiry form

If you would like to submit an inquiry regarding driven tools, you can find a detailed inquiry form in the download area of our website. Please fill in this form carefully and send it to us via email or fax.
→**cutting.tools/en/download**

Modular quick-change systems for driven tools

Do you want to optimize your setup times? CERATIZIT offers multiple ways of doing this! With one axial driven tool and one radial driven tool you are prepared for a wide range of machining demands as a result of the option of swapping various modules.

Varia VX

The new quick-change system for heavy duty machining

The face and taper contact interface ensures maximum radial run-out accuracy. The torque is transmitted via a form-fitting polygon, which can transmit up to 200 Nm.

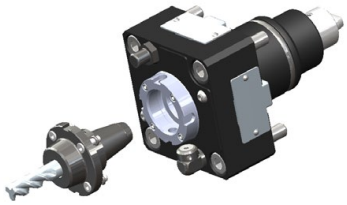
Clamping and releasing takes place via a segmented gear wheel equipped with three multifunctional cams. When tightened with a radially mounted clamping screw, the 3-point clamping pulls the tool evenly into its operating position. When releasing, the tool force is applied mechanically via a sliding cam and the tool is released for removal from the adapter.

The advantages at a glance

- Cutting tools are preset off the machine
- Quick change thanks to only one clamping point
- No risk of injury when changing tools
- Transverse force-free clamping of the tools
- Safe torque transmission
- No loose parts

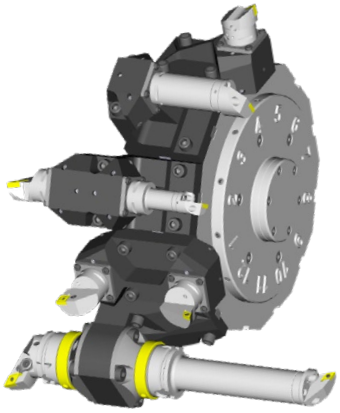
Preci-Flex® system – The stable solution for long tool life and high surface quality

The internal taper of the driven tools is suitable for any commercial type ER collets. The face and taper contact makes it possible to achieve ≤ 0.01 mm system radial run-out accuracy and ≤ 0.005 mm repeatability and the four clamping screws on the front face help to achieve maximum stability and system rigidity.



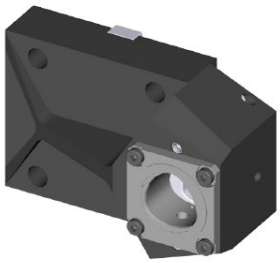
The range includes base holders for the collet sizes ER20, ER25, ER32, ER40, and ER50 and collet chucks with male or female nut, Weldon, Whistle Notch, shrink, boring bar, and shell mill adapters, hydraulic chucks, test arbors, and blanks. Also available for static VDI holders and rotating SK and HSK holders.

Quick-Change

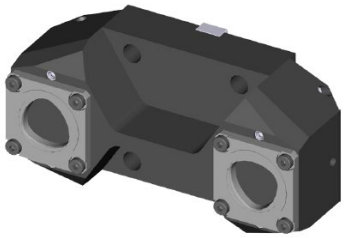


The tool holder range comprises both innovative and technologically proven solutions for all common CNC turning centers. We offer solutions that are perfectly tailored to the make of machine, regardless of whether the machine has a BMT, VDI, or other connection type.

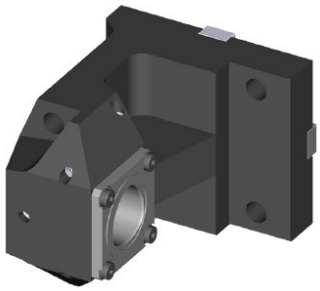
Every quick-change system has a standardized interface to DIN/ISO requirements and is available for HSK-T 40/63/100 and PSC 40/50/63 sizes. The tool change itself is carried out quickly and easily, minimizing idle times and thus boosting productivity.



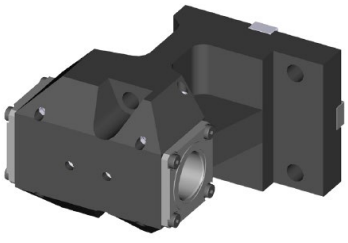
Tool holder single and straight



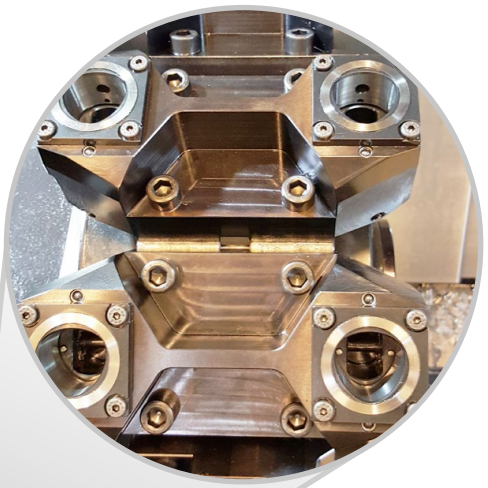
Tool holder double and straight

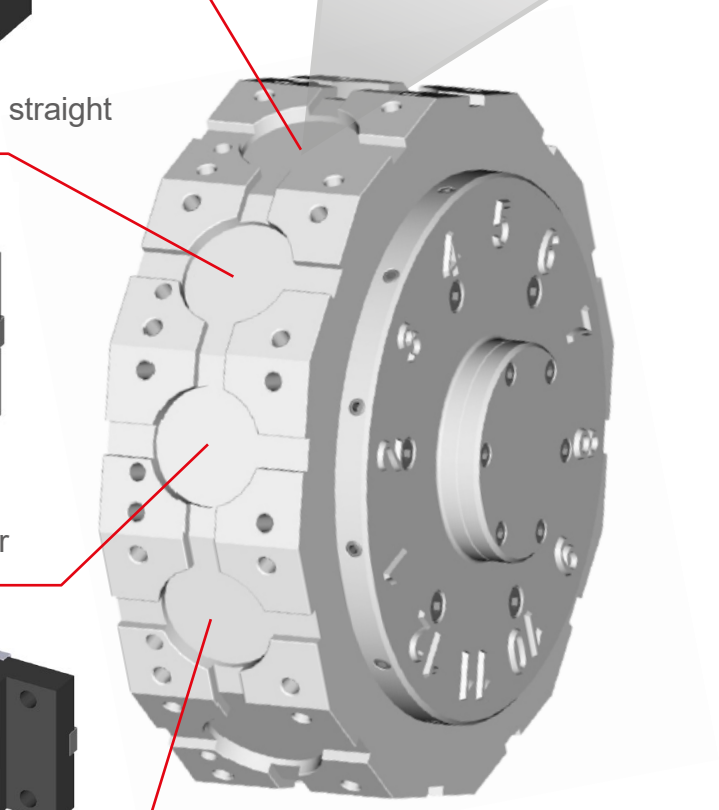


Single angle tool holder



Double angle tool holder

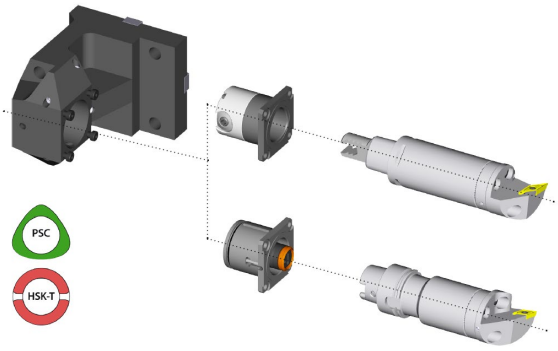




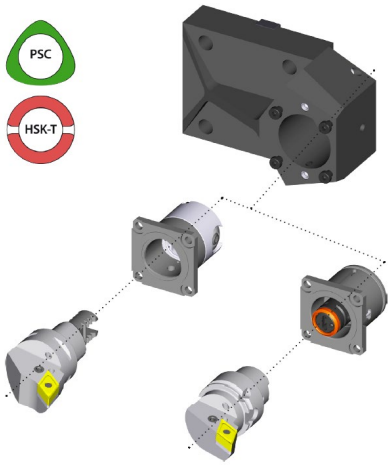
Revolver disc BMT/VDI/…

HSK/PSC clamping units

- The tool holders are fitted with either an HSK or PSC clamping unit.
- Clamping units are available in sizes HSK 40/63/100 and PSC 40/50/63.

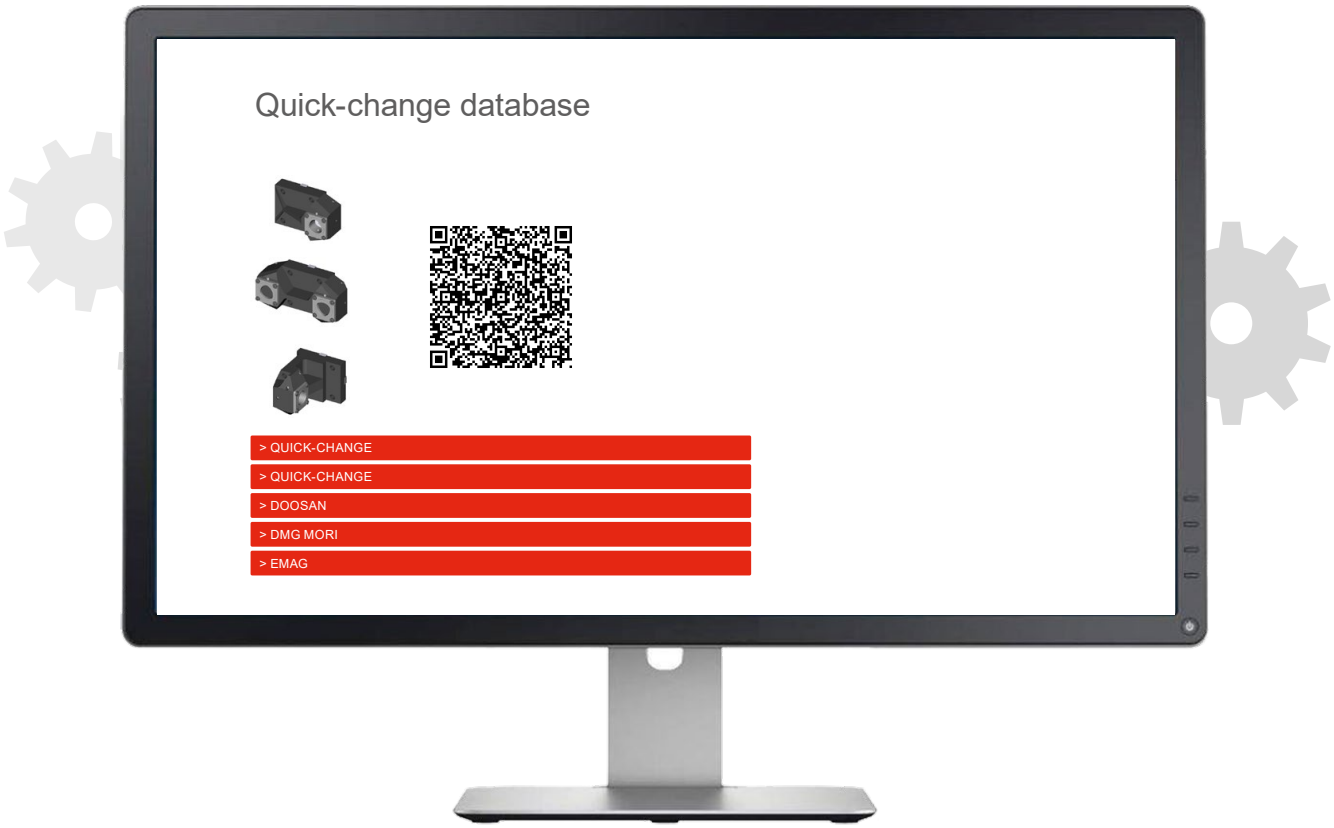


- The tool holders can therefore be flexibly adapted to the customer's requirements.



Online database

Our quick-change tool holders are individually adapted to turning machines to ensure the greatest possible levels of flexibility and efficiency. Using the online database, systems of previously specified machine types can be evaluated in order to obtain an initial overview.



Information on inquiry process

- To make the inquiry process as easy as possible, please use our inquiry form to enter the most important machine data and information on the machining process.
  Please fill in this form carefully and send it to us by email or fax.→ **cutting.tools/en/download-quickchange**

  If you have any questions regarding the ordering process or the form itself, your CERATIZIT Technical Sales Engineer will be happy to help.

ISO 12164 – HSK-E

- Applied for higher rpm (HSC) for high speed spindles with automatic tool change
- Rotation symmetrical, without keyways
- Torque transmission through friction
- **Possibility of central coolant supply via coolant pipe**

Technical information for polygon shank adapters

ISO 26623-1

	d_1	$d_{3\pm0,05}$	$l_{2\pm0,1}$	l_3	$l_{11\pm0,1}$	l_{16}	D_m
PSC 32	32	16,5	19	15	13,5	9	22
PSC 40	40	20	24	20	17,5	12	28
PSC 50	50	24	30	20	22	12	35
PSC 63	63	32	38	22	26	12	44
PSC 80	80	38	48	30	34	12	55

Advantages of the PSC interface

The repeatability of the PSC shank is ± 2 microns

The tapered polygon in conjunction with the tight manufacturing tolerances provides backlash-free centering and also acts as a drive dog. The PSC taper has very high rigidity and bending strength. The main advantages of this interface are the transmittable torque stability, the resistance against radial forces acting on the tool, and the exact center height. This means large material cross sections can be machined and high feed rates achieved. The PSC interface is ideally suited to all machining operations such as drilling, turning, and milling.

High pressure and hydraulic chucks

The right hydraulic chuck for a wide range of machining scenarios

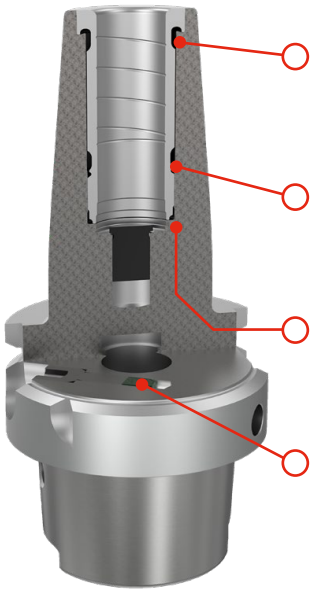
Are you looking for higher cutting speeds to boost productivity and straightforward handling? The entire range of high pressure chucks and the range of hydraulic chucks from CERATIZIT guarantee easy, process-secure tool clamping for every application.

High pressure chuck		Application range
Rough	Milling with strong forces > roughing	▽▽▽ ▽▽ ▽
Complus	First choice – general purpose	▽▽▽ ▽▽ ▽
Access 3°	Optimum accessibility	▽▽▽
Access 4.5°	Optimum accessibility thanks to the same interference contour as the heat shrink adapter; state-of-the-art technology	▽▽▽ ▽▽

Hydraulic chuck		Application range
Fit	First choice – general purpose	▽▽▽ ▽▽
Turn	Perfect for turning operations	▽▽▽ ▽▽
Compact	Affordable all-round alternative	▽▽▽ ▽▽

Main application	▽▽▽	Finishing	▽▽	Roughing-finishing	▽	Roughing
Secondary application	▽▽▽		▽▽		▽	

Maximum performance and productivity



New chamber design makes it possible to reverse the force at critical solder joints (from tensile to compression load), enabling significantly higher radial loads during machining.

New chamber design significantly reduces the technology's susceptibility to temperature (up to 80°C even during milling operations lasting up to 240 minutes).

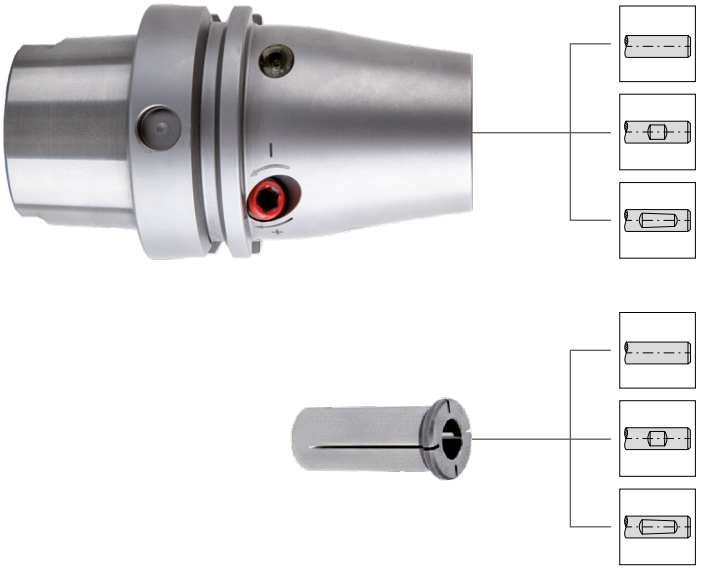
If there are multiple instances of unintended shrinking, the soldering system includes an emergency outlet to prevent potential injuries.

Double-lip sealing system dramatically increases the service life of the hydraulic chuck (over 10,000 clamping cycles under laboratory conditions).

High pressure and hydraulic chucks

Clamping of shanks with flats possible with or without reduction sleeve

HSS shanks DIN1835 and
solid carbide shanks DIN6535



Main areas of application

- HPC milling
- HSC milling
- Hard machining
- Drilling
- Reaming

Clamping force comparison with different systems

This comparison shows the higher retention forces of the high pressure chuck. A high clamping force is particularly important in the HPC machining of larger clamping diameters, as otherwise the tool may be pulled out of the adapter. The high pressure chuck now offers you this process security.

Main advantages

- Increased process security
- Longer tool life
- Improved surface quality
- Extended spindle life

Shank diameter	16	18	20	25	32	mm
	Maximum transmissible torque with shank tolerance h6					
Hydraulic chuck	170	240	330	400	650	Nm
High pressure chuck	350	430	520	650–750	800–890	Nm
Heat shrink adapter	200	290	450	530	700	Nm

Explanation of symbols

Smooth cylindrical shank

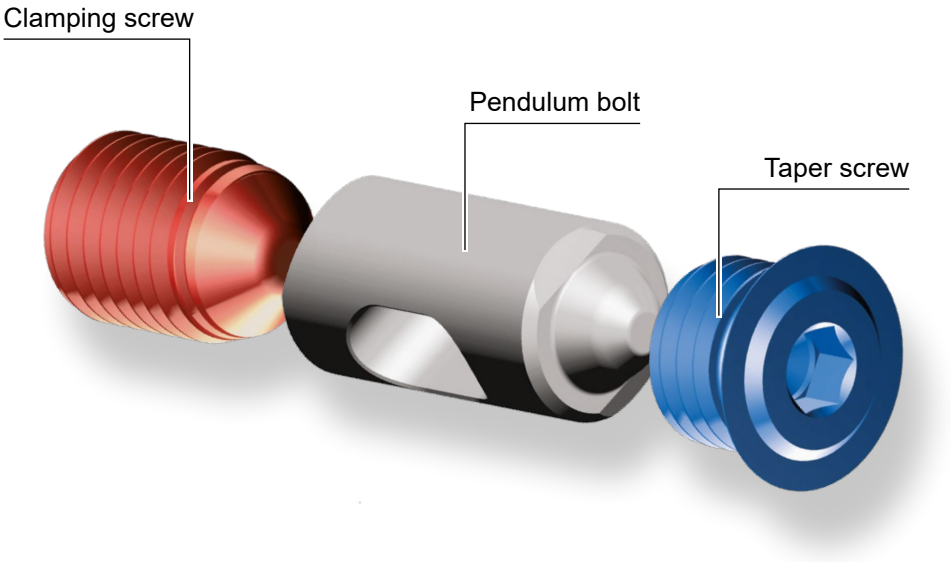
ER 32 tightening torque 180 Nm																			375	Nm

Measurement of the specified clamping forces was performed exclusively statically. The actual clamping forces that arise during machining may deviate due to various influences (vibrations, oscillations, machining situation).

Technical information – ABS

Even better connected

The extension of the proven ABS system complements the existing portfolio and continues to meet the high demands on accuracy. The adapter is an important element in tooling systems between the cutting tool and the machine. It must be able to reliably transmit the cutting forces that are produced. Adapters also have a considerable impact on the quality of the machining result. They also contribute to the cost-effectiveness of the machining process.



Advantages

- Improved force transmission
- Optimum machining result
- Higher cutting values possible
- Less noise pollution in production
- System fully compatible upwards and downwards
- Suitable for ABS, ABS N, and ABS T

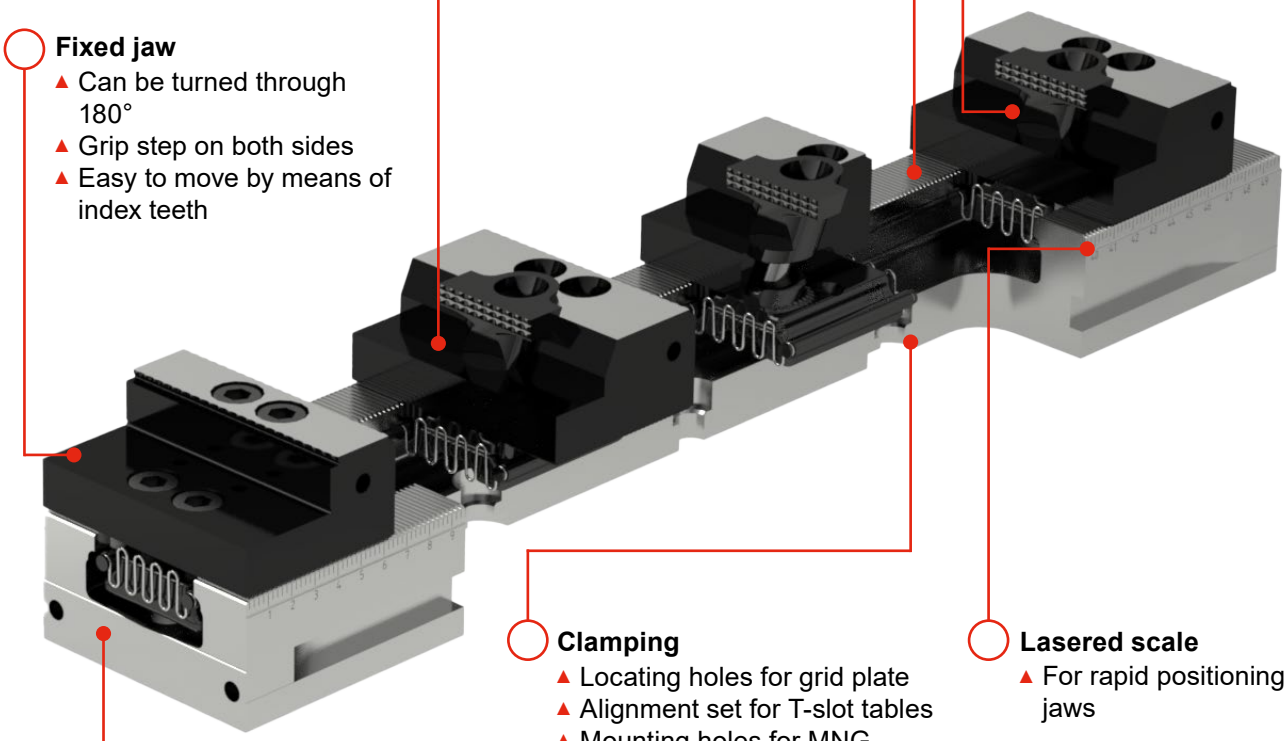
Adjustable jaw
- Just one screw size for the entire system
- Quick and easy handling thanks to jaw positioning from above

Teeth hardened and ground
- High precision and dimensional stability
- Protection against damage and wear

Jaws
- Screws in and out for quick change
- Pull-down jaw 40 mm
- Parallel clamping jaws 40 / 65 / 90 mm
- Pendulum jaw grip 90 mm

Fixed jaw
- Can be turned through 180°
- Grip step on both sides
- Easy to move by means of index teeth



Clamping
- Locating holes for grid plate
- Alignment set for T-slot tables
- Mounting holes for MNG mounting bolts

Lasered scale
- For rapid positioning of the jaws

Extremely rigid clamping bar
- Width 90 mm
- Lengths from 260 mm to 650 mm

Clamping system overview

Single vice

- Power-assisted systems NCG, HDG 2, and H5G
- Fixed jaws as reference
- High repeatability
- Excellent angular accuracy

High precision and force amplification

Centric vice

- Symmetrical clamping
- Excellent accessibility for 5-sided machining
- Component zero point always centered
- High repeatability

High process security with sealed system

Multiple vice

- Faster setup times
- Multi-functional
- Optimum utilization of the machine table
- High repeatability

Increased machine uptime

Stationary three-jaw chuck – SBF 3

- Suitable for 3/5-axis machining of round components
- Compatible with PNG and MNG zero point clamping systems
- Wedge bar drive
- Hardened and stiff base body
- Optimized lubrication system

Ø 200 mm

Ø 315 mm

The perfect clamping situation for round components

Clamping variants

- Zero point clamping systems
- Zero point clamping system grid plates
- MNG – mechanical zero point clamping system
- PNG – pneumatic zero point clamping system

Reduction in setup times

Clamping towers

- Tombstone clamping tower
- Triangular clamping tower
- Cruciform clamping tower
- Cube clamping tower

Automation made easy

Systematic clamping

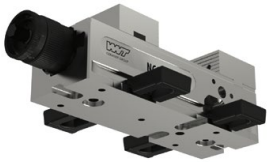
Modular machine vice as a system with clamping by tension. Unique, patented fast handle clamping with mechanical power assist and minimal setup times.

The benefits for you:

- Quick adjustment using a crank handle
- Quick positioning with MNG on the machine table without an intermediate pallet
- Clamping force can be continuously adjusted 4–40 kN
- 160° quick clamping
- Quick and easy jaw change with 4 screws
- Easy cleaning thanks to rapid disassembly of the entire spindle unit
- Extensive modular jaw range

Clamping/aligning:

Clamping with two dowel screws 12_{f7} / M12 (NCG 100) **Article no. 80 890 313** or 16_{g5} / M16 (NCG 125 / 160) **Article no. 80 890 314**



Alignment through 20^{H7} precision slot nuts in the base body and clamping with clamping claws

Alignment and clamping with MNG zero point clamping system (2-3 mounting bolts)

CoreLine – NC-quick clamping vice with combi reversible jaw plus – NCG

CoreLine – NC quick clamping vice 5A with high support jaws – NCG 5A

- ▲ Fast 160° handle clamping
- ▲ Rapid installation and removal of the spindle assembly
- ▲ S = powerstroke
- ▲ Ideally suited to 5-axis machining due to optimum accessibility
- ▲ Reversible jaws for clamping range extension
- ▲ 100 mm base body has 2 slots for moving the fixed jaw
- ▲ 125 mm base body has 3 slots for moving the fixed jaw

Scope of supply:
NC quick clamping vice incl. 2 high base jaws, 2 stepped grip jaws 5 mm, 1 clamping lever, 4 clamping claws

5-axis optimized clamping system

The powerful clamping system for "real" 5-axis complete and simultaneous machining.
1 and 2-sided machining with clamping by tension and 40 kN directly on the workpiece.

The benefits for you:

- Quick conversion – complete clamping range adjusted in just a few seconds
- Quick positioning with MNG on the machine table without an intermediate plate
- Clamping force can be continuously adjusted 4–40 kN
- 160° quick clamping
- Jaw turning – fast and easy jaw change with 4 screws
- Easy cleaning, spindle completely protected
- Extensive modular jaw range

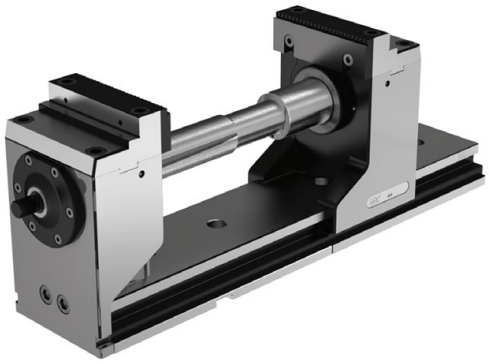
Clamping/aligning:

Clamping with two dowel screws
Ø 12_{f7} / M12 **Article no. 80 895 019**

Alignment through 20^{H7} precision slot nuts in the base body (H5G) and alignment sets 14 / 16 / 18 in the T-slot of the machine table. Clamping with clamping claws.

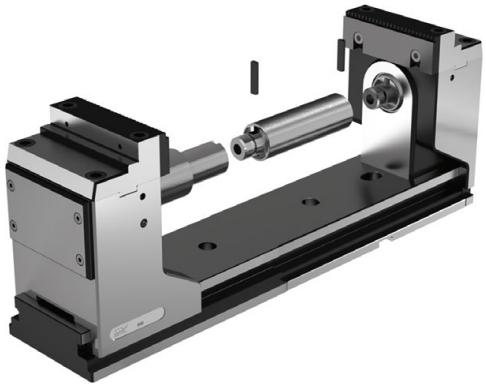
Alignment and clamping with MNG zero point clamping system (2-3 mounting bolts). **Optional:** Positioning and mounting holes on customer request.

Alignment of base body extension:



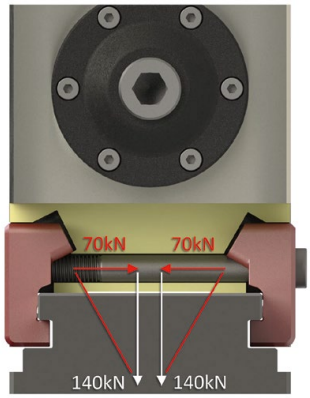
- Loosely mount base body extension
- Distance to basic base body 0.2–10 mm
- Slide the movable supporting jaw overlapping onto both base bodies
- Align base body extension parallel to the basic base body
- Secure the base body extension

Fitting the drawbar extension:



- Fit the base body extension (see alignment above)
- Screw the drawbar extension onto the spindle
- Insert the first anti-twist protection
- Slide the movable supporting jaw onto the base body extension
- Connect the extended drawbar to the fixed supporting jaw
- Insert the second anti-twist protection

Movable fixed jaw functional principle:



Double-acting screw = double the force
Angled surfaces = double the force

Both supporting jaws can be moved as desired for the H5G-Z and H5G-Z-S. The movable fixed jaw can be retained via 1 or 2 screws (1 = H5G-Z / 2 = H5G-Z-S) in any position on the base body (tighten screw to 90 Nm). The clamping force of the fixed jaw is almost identical to that of the H5G that is secured with four screws.

CoreLine – 5-axis high power vice with quick adjustment – H5G

- ▲ Crank handle quick clamping
- ▲ Vice with quick span adjustment
- ▲ 100% sealed
- ▲ Vice with longitudinal and transverse grooves 20 H7 and alignment holes Ø 12 F7

Scope of supply:
Vice including 4 clamping claws, crank handle, and clamping key

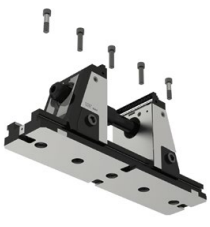
5-axis machining to perfection

Maximum ease of handling and integrated pull-down action for 6-sided machining. X5G-Z is the new 5-axis vice from CERATIZIT. All the advantages that ensure optimum and simple 5- and 6-sided machining combined in a single clamping device.

The benefits for you:

- 5- or 6-sided machining can be selected by clamping one or both supporting jaws
- Fast jaw changeover without tools
- Optimum accessibility from all sides and large base clamping stroke of 130 mm
- Fully sealed, mechanical spindle
- Integrated, internal elastomer damping to minimize vibrations
- Extensive modular jaw range

Clamping/aligning:



Clamping with two dowel screws Ø 12_{r7} / M12 and clamping screws **Article no. 80 895 019**

Alignment through 20^{H7} precision slot nuts in the base body in the T-slot of the machine table. Clamping with clamping claws.

Alignment and clamping with MNG zero point clamping system (2-3 mounting bolts). **Optional:** Positioning and mounting holes on customer request.

Clamping force:

Size		Max. tightening torque in Nm	Max. clamping force in kN

HyPower – Mechanical 5-axis vice with movable fixed jaws – X5G-Z

- Without system jaws
- Optimum accessibility
- 5- and 6-sided machining possible
- Fast jaw changeover
- Clamping on the machine table is possible with MNG/PNG, or directly through the base body

MNG **PNG** **X5G -Z**

Procedure for hardened precision jaw set

The X5G-Z impresses with its extreme accuracy. All the components have been ground or hard-milled to a high level of precision. Despite this, there are still applications in which the precision requirements cannot be satisfied in full due to the tolerance chain of the indexable grip jaws. For these situations, we offer a hardened precision jaw set (article no. **8090831300**) that can be hard-milled by the customer on the clamping flat (both sides).

Hard machining is carried out in the precision vice (both screws on the supporting jaws tightened to 140 Nm). The precision jaws must be hard-milled as per the views shown (1+2). The reference tip supplied is used for clamping in the standard position (1). An end gage can be used for clamping in the VS position (2).

Highly efficient all-rounder for machining unfinished and finished parts

The ESG 4 single vice impresses with its fast handle clamping, quick setting of the clamping range, a flat design, and low weight.

The benefits for you:

- Several coolant flows for smooth operation and controlled outflow
- Quick and easy positioning on the MNG zero point clamping system
- High clamping forces between 5–50 kN with low tightening torque
- Quick and easy jaw change with 2 screws
- Quick, simple disassembly of the spindle unit
- Extensive modular jaw range

Clamping/aligning:

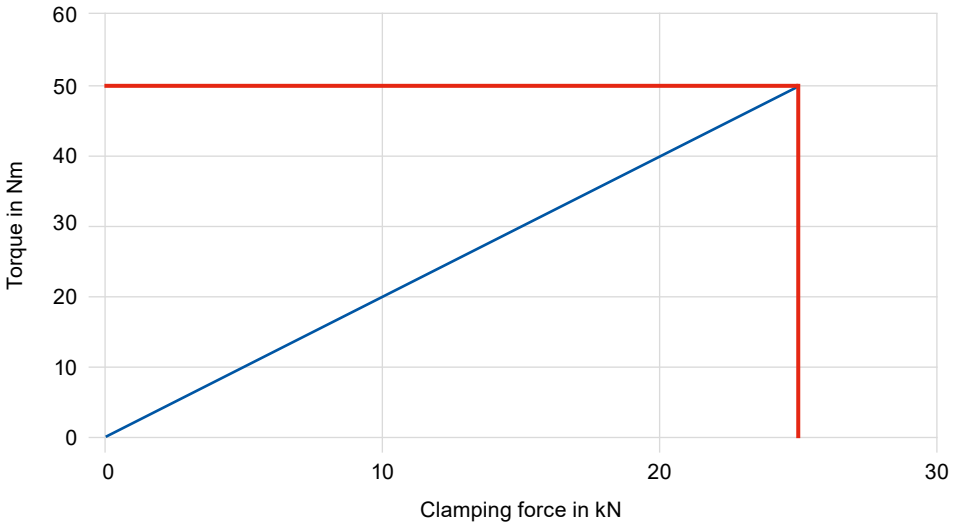
ESG 4 – 80 mm = mounting with M8 screws through the base body
ESG 4 – 125 mm / 160 mm = mounting with M12 screws and dowel screws through the base body

Mounting with 4 clamping claws **Article no. 80 890 315**

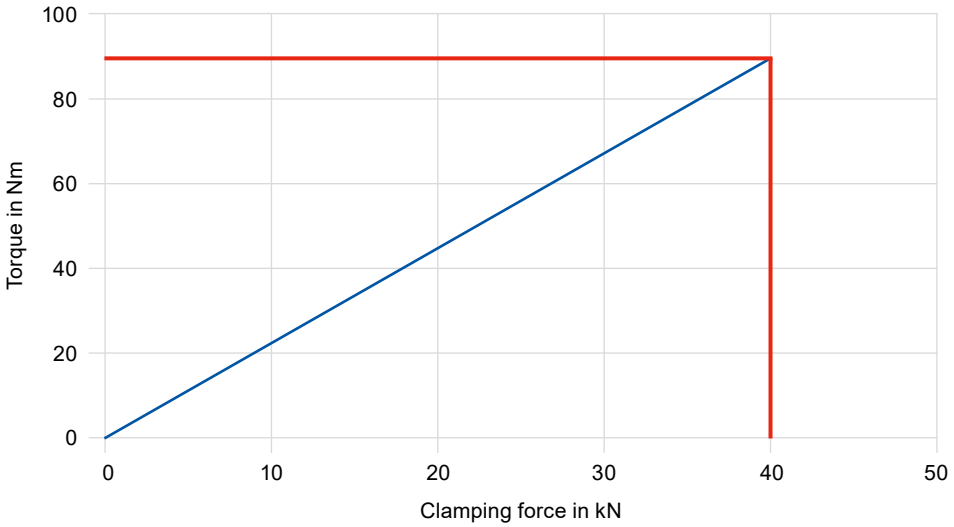
Mounting with zero point clamping system
ESG 4 – 80 mm = 1 mounting bolt + anti-twist protection
ESG 4 – 125 / 160 mm = 2 mounting bolts center distance 200 mm

Clamping force:

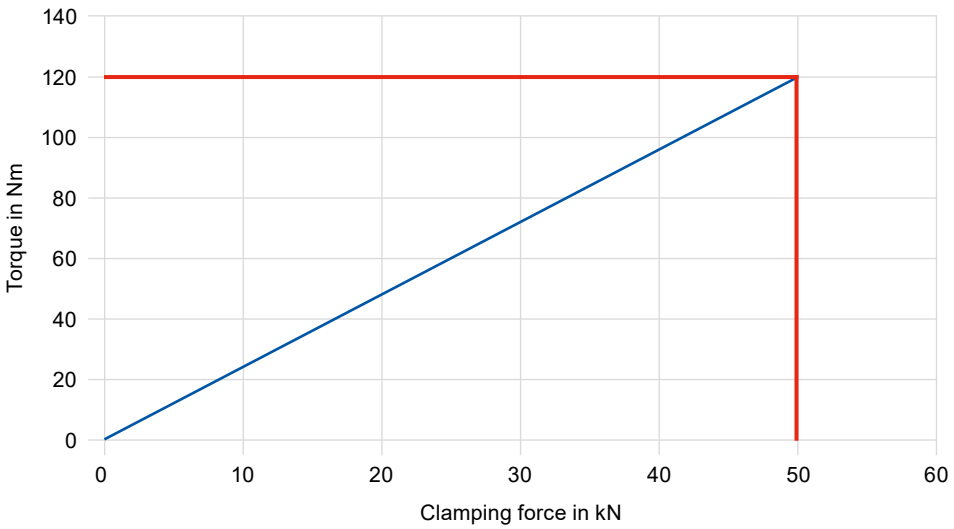
ESG 4 – 80 mm tightening torque/clamping force



ESG 4 – 125 mm tightening torque/clamping force



ESG 4 – 160 mm tightening torque/clamping force



CoreLine – Single vice without system jaws – ESG 4

▲ Fast 160° handle clamping with torque key
▲ Rapid installation and removal of the spindle assembly
▲ ±0.01 mm repeatability (±0.015 mm when A = 160 mm)

The optimized ESG 5 – Maximum precision and process security

The new ESG 5 retains all the cherished characteristics of its predecessor and raises the bar significantly with regard to user-friendliness and durability. Optimized handling and improved durability were top of the list in the update for the single vice.

The benefits for you:

- Specially designed for second side machining due to high angular accuracy
- Compact design with ideal accessibility
- Jaw change is quick and easy with two screws
- The same clamping ranges, significantly improved interference contour, comprehensive modular jaw range
- Sustainable model with nickel-plated base body ensures a long service life

Clamping/aligning:

Mounting with zero point clamping system
ESG 5 – 80 mm L-130 mm + L-190 mm
ESG 5 – 125 mm L-160 mm + L-235 mm

1 mounting bolt + MNG indexing bolt

Mounting with zero point clamping system
ESG 5 – 125 mm + L-300 mm
ESG 5 – 160 mm + L-280 mm + L-480 mm

2 mounting bolts

All variants have Ø 12^{JS} precision holes for the exact positioning of the ESG 5. All variants can be mounted with screws from above through the base body.

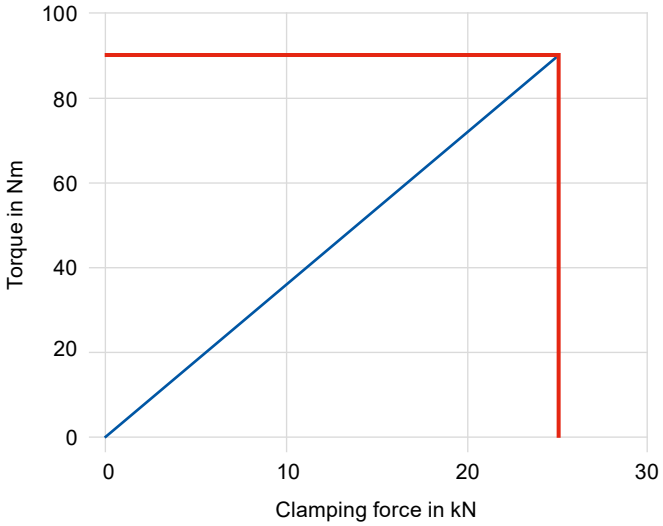
Clamping/aligning:

ESG 5 – 125 mm L-235 mm + L-300 mm
ESG 5 – 160 mm L-280 mm + L-480 mm

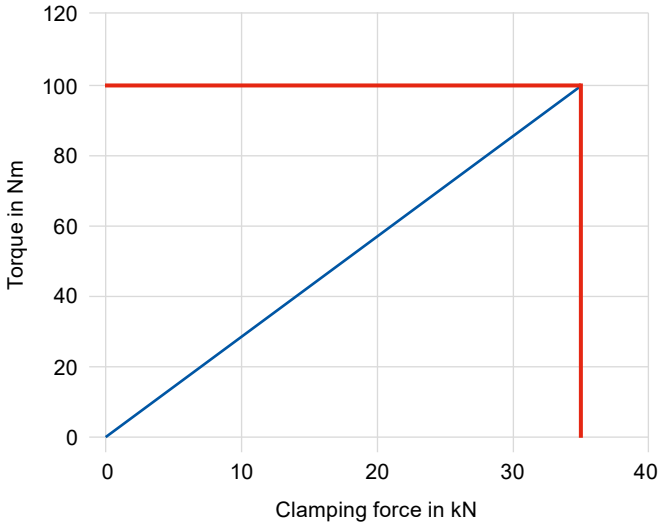
These 4 variants can also be clamped with clamping claws as an alternative.

Clamping force:

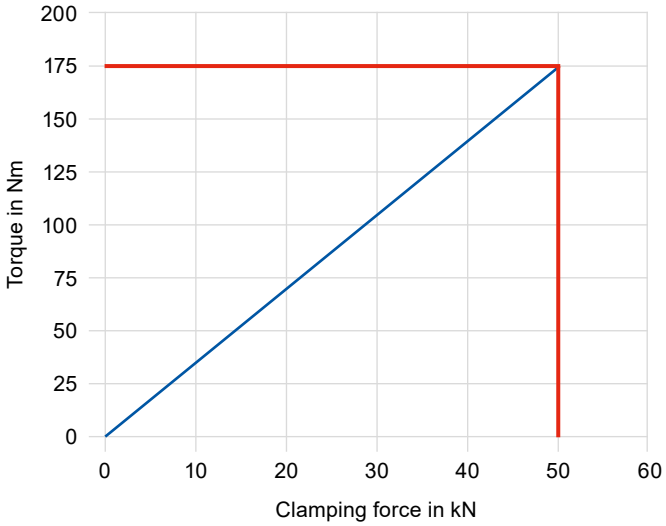
ESG 5 – 80 mm tightening torque/clamping force



ESG 5 – 125 mm tightening torque/clamping force



ESG 5 – 160 mm tightening torque/clamping force



CoreLine – Sealed single vice without system jaws – ESG 5

- Specially designed for second side machining due to high angular accuracy
- ±0.01 mm repeatability between the clamping processes
- Suitable for PNG and MNG

Tried-and-tested high pressure clamping system

Mechanical machine vice with continuous clamping force adjustment of 10% to 100% with only a single turn of the handle and always the same handle end position. Quick clamping range adjustment via locking pins.

The benefits for you:

- Saves time and effort – only one turn of the handle
- Clamping time of less than one second
- Easy handling
- Can be continuously adjusted without tools
- High machining precision

Clamping/aligning:

Alignment through precision slot nuts with a 20^{H7} longitudinal or transverse slot in the base body

Clamping with screws through the base body or laterally with clamping claws

CoreLine – High pressure vice – HDG 2

- ▲ Continuous power adjustment
- ▲ Mechanical power transmission
- ▲ Clamping force with only a single turn of the handle
- ▲ Movable jaws, pre-machined to accommodate jaws for clamping range extension

Scope of supply:
High pressure vice incl. 4 clamping claws, crank handle, 2 profiled and hardened top jaws

The optimized ZSG 4 – Maximum precision and process security

The new ZSG 4 retains all the cherished characteristics of its predecessor and raises the bar significantly with regard to user-friendliness and durability. Optimized handling and improved durability were top of the list in the update for the popular centric vice.

The benefits for you:

- Specially designed for second side machining due to high angular accuracy
- Compact design with ideal accessibility
- Jaw change is quick and easy with two screws
- The same clamping ranges, significantly improved interference contour, comprehensive modular jaw range
- Sustainable model with nickel-plated base body ensures a long service life

Clamping/aligning:

Mounting with zero point clamping system
ZSG 4 – 80 mm L-130 mm + L-190 mm
ZSG 4 – 125 mm L-160 mm + L-235 mm

1 mounting bolt + MNG indexing bolt

Mounting with zero point clamping system
ZSG 4 – 125 mm + L-300 mm
ZSG 4–160 mm + L-280 mm + L-480 mm

2 mounting bolts

All variants have Ø 12^{JS} precision holes for the exact positioning of the ZSG 4. All variants can be mounted with screws from above through the base body.

Clamping/aligning:

ZSG 4–125 mm L-235 mm + L-300 mm
ZSG 4 – 160 mm L-280 mm + L-480 mm

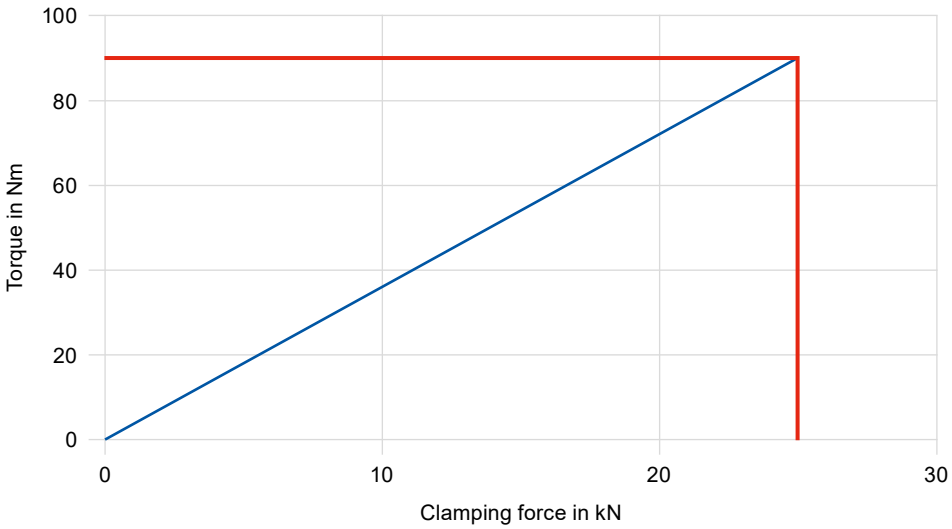
These 4 variants can also be clamped using clamping claws.

ZSG 4–80 mm L-130 mm + L-190 mm
ZSG 4 – 125 mm L-160 mm + L-235 mm + L-300 mm
ZSG 4 – 160 mm L-280 mm

All 5 variants also have mounting holes for the LANG zero point clamping system.

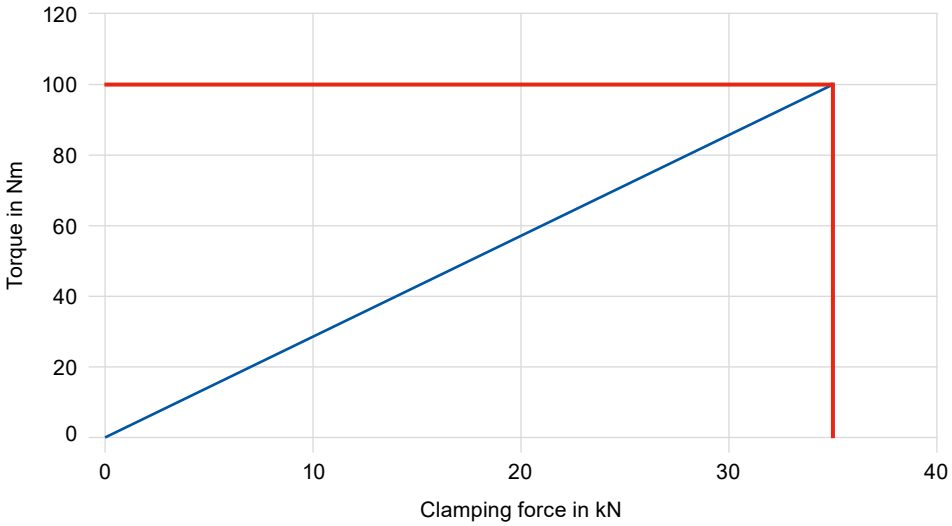
Clamping force:

ZSG 4 – 80 mm tightening torque/clamping force

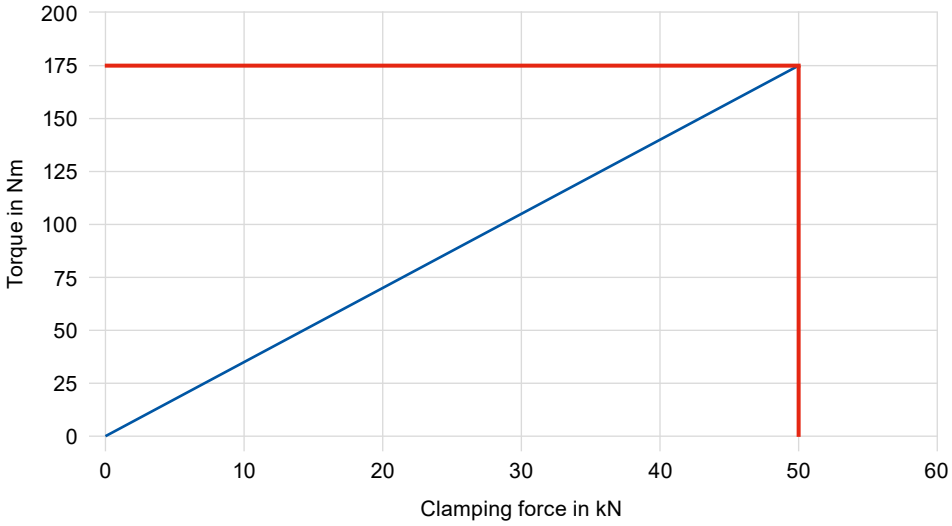


Clamping force:

ZSG 4 – 125 mm tightening torque/clamping force



ZSG 4 – 160 mm tightening torque/clamping force



CoreLine – Sealed centric vice without system jaws – ZSG 4

- ▲ Ball bearing mounted spindle
- ▲ ±0.01 mm repeatability between the clamping processes
- ▲ Suitable for PNG and MNG

Centric vice for small parts

ZSG mini in mechanical version with high clamping force and quick change jaws. Ideal for blank and finished part machining, multi-clamping, and automation.

The benefits for you:

- Fast jaw changeover without tools
- Compact and precise
- Optimum accessibility from all sides
- Exchangeable jaw widths (45 mm and 70 mm)
- High clamping force and large clamping range
- Clamping system for automation
- Stainless, hardened base body

Clamping/aligning:

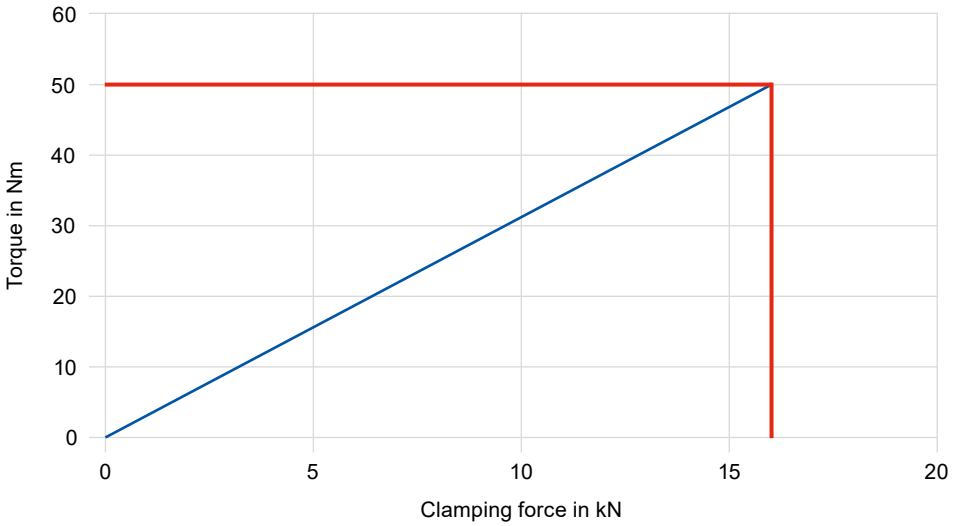
Clamping with two M6 screws from above through the base body.

Clamping with two M6 screws from above through the base body. Alignment can be performed using Ø 12^{H7} precision holes.

Both versions come with mounting holes for the LANG zero point clamping system, Quick Point 52 x 52.

Clamping force:

ZSG mini tightening torque/clamping force



CoreLine – Centric vice for small parts without system jaws – ZSG mini

- ▲ Fast jaw changeover without tools
- ▲ Compact and precise
- ▲ Optimum accessibility from all sides
- ▲ Exchangeable jaw widths (45 mm and 70 mm)
- ▲ Stainless, hardened base body

Scope of supply:
ZSG mini base body with spindle

Highly accurate and efficient

The user-friendly DSG 4 clamping system guarantees consistently high precision and a wide application range.

The benefits for you:

- Straightforward, stable third-hand function
- Quick and easy positioning on the MNG zero point clamping system
- High clamping forces between 5–40 kN with low tightening torque
- Quick and easy jaw change with 2 screws
- Extensive modular jaw range

Clamping/aligning:

Mounting with MNG zero point clamping system (2-3 mounting bolts)

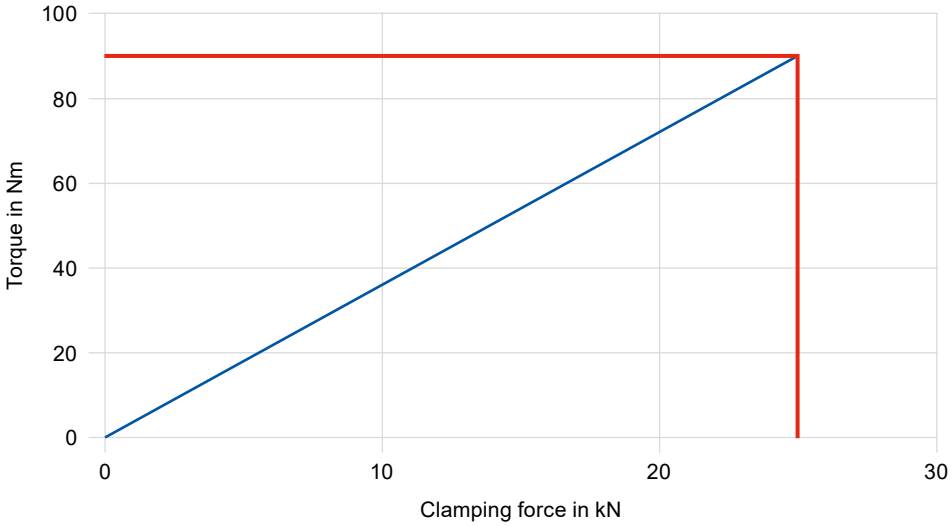
Mounting through the base body with four M8 screws

Mounting through the base body with two dowel screws **Article no. 80 895 019**

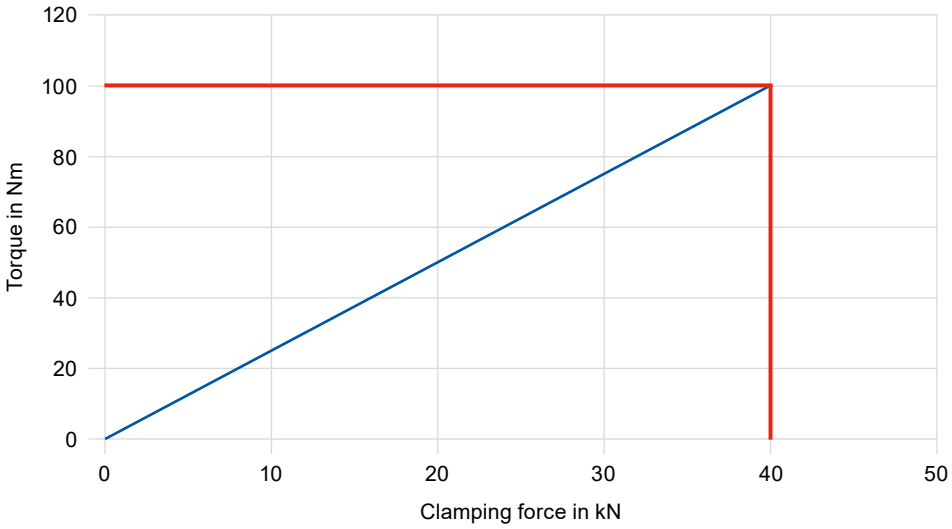
Mounting with 4-6 clamping claws **Article no. 80 890 315**

Clamping force:

DSG 4 – 80 mm tightening torque/clamping force



DSG 4 – 125 mm tightening torque/clamping force

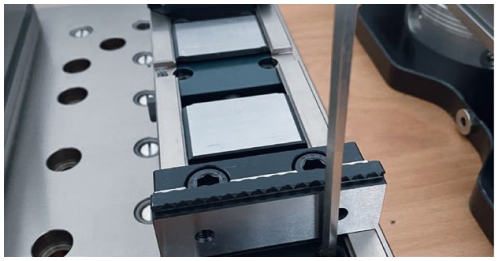


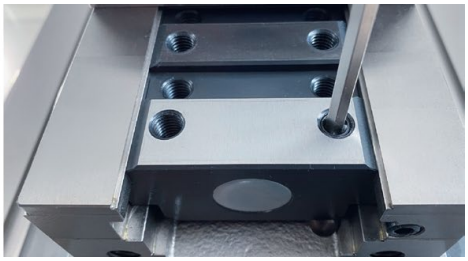
'Third-hand' operation

The third-hand operation function on the DSG 4 is ensured by pre-loading the rear slide with compression springs.

The lateral clamping screw A is not tightened, instead it is open approx. 1/2 turn. When the vice is fully open, the movable jaws B and C are to be placed in the appropriate slots of slides D and E and secured according to the workpiece size. Two workpieces of different sizes can also be clamped.

Conversion to single vice





The rear slide is blocked via the hexagon socket grub screw and the DSG 4 can also be used as a single vice. **Important note:** Not suitable for using several vices as single vice next to one another. In this case, we recommend modification with additional transverse slot in the base body and suitable fixed jaw.

CoreLine – Double vice without system jaws – DSG 4

- 100% sealed
- Quick assembly/disassembly
- Flexible clamping system

The all-rounder for workpiece clamping

The new multiple vice enables you to easily clamp many small and large workpieces on a 3-, 4-, or 5-axis machine. Even slimmer jaws have further increased the part thickness.

The benefits for you:

- Hardened and ground teeth ensure the highest level of precision and dimensional stability
- Fast jaw changeover system for fixed and adjustable jaws
- Full modular range for all types of machining centers
- Multi-clamping with wedge grip elements
- Extensive modular system jaw range
- Simple clamping bar extension with connecting element

Clamping/aligning:

Using T-slots or screws
Alignment in the T-slot (14, 16, 18 mm) with the matching alignment set for T-slots. For 12 mm T-slot: use two Ø 12 cylinder pins.

Using clamping claws
Alignment set and clamping using clamping claws attached at the side.

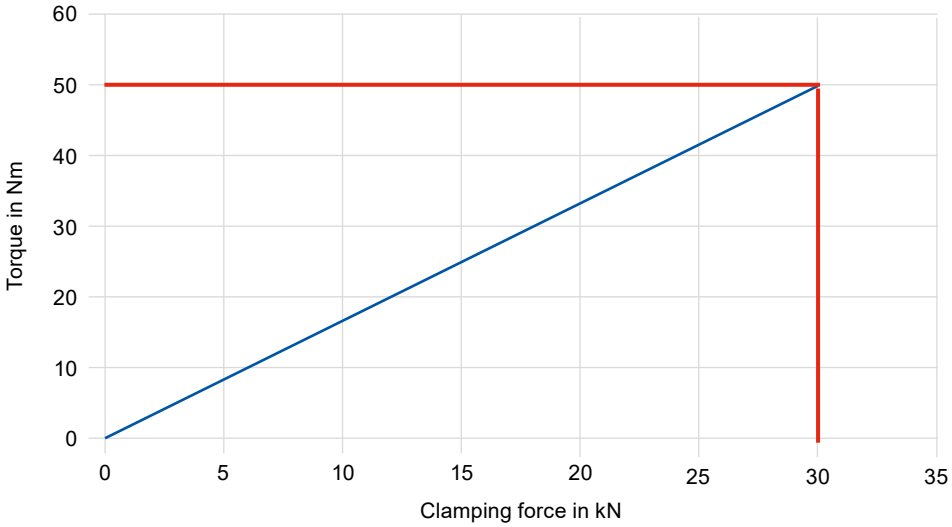
Using grid holes
Position and fasten the workpieces using two Ø12f7 / M12 dowel screws in the first and last holes of the clamping bar. Additional fastening using M12 cylindrical screws in the remaining holes.

Clamping/aligning:

With a zero point clamping system
The clamping bar is equipped with MNG interfaces that enable MNG clamping bolts to be attached (up to a base body length of 500 mm = 2 clamping bolts / from 600 mm upwards = 3 clamping bolts).

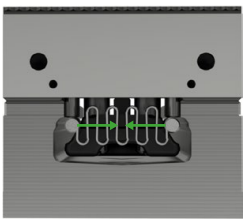
Clamping force:

Verso tightening torque/clamping force



Quick jaw change for fixed and adjustable jaws

The Verso multiple vice is equipped with a quick jaw change system as standard. Simply use the two screws to release, remove or reposition the fixed and adjustable jaw. The jaws are removed in an upwards direction, allowing each jaw to be removed individually, without taking out any others. This reduces the set-up time significantly.

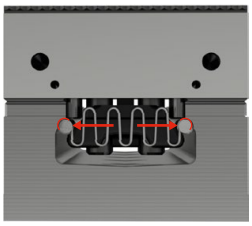


Release position

Undo screws

Take off and insert

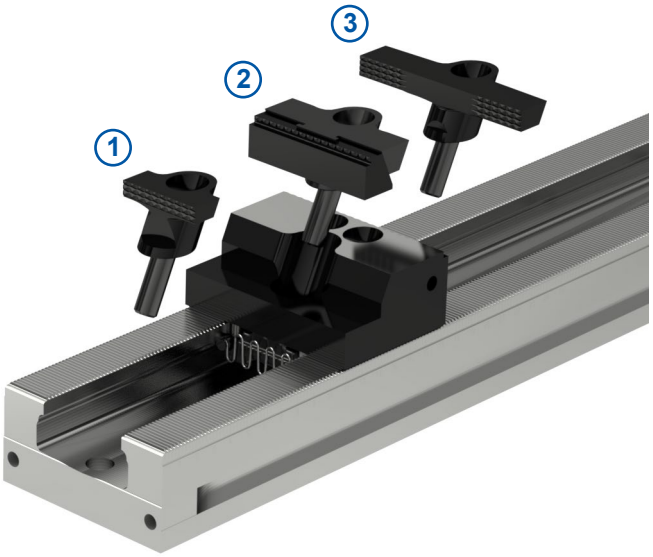
Tighten screws



Clamping position

Quick jaw change

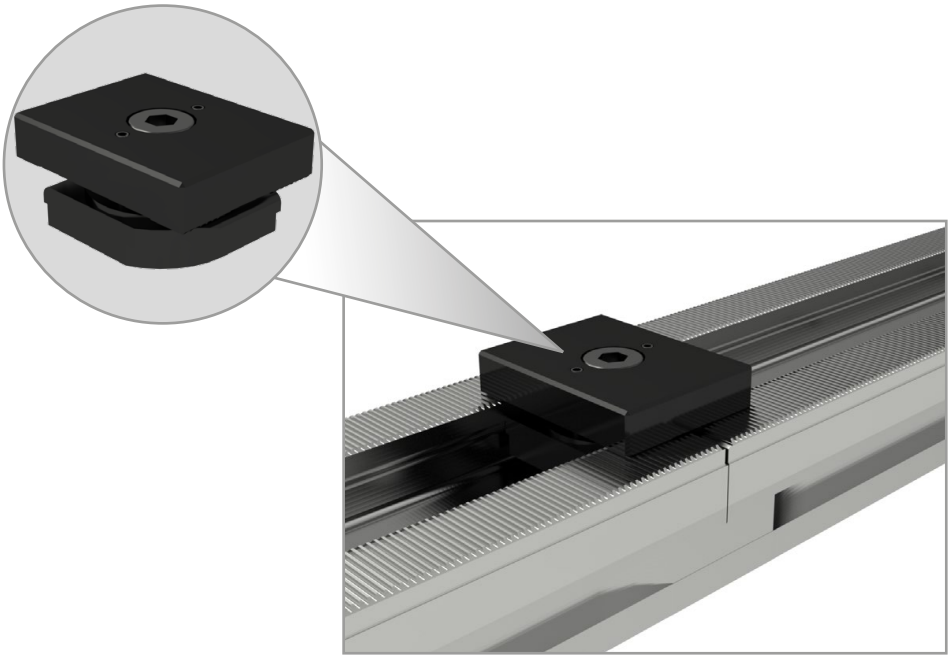
The fixed and adjustable jaws of the Verso multiple vice system are equipped with a quick jaw change system as standard. Two screws can be used to release and change the jaw, making jaw changes extremely quick.



1. Pull-down jaw, grip
2. Parallel clamping jaw
3. Pendulum jaw grip with pull-down action

Connecting the clamping bars

A connecting element allows two or more Verso clamping bars to be combined with one another or extended.



CoreLine – Multiple vice without system jaws – Verso

- For single and multi-clamping
- Multi-clamping with wedge grip elements
- Workpieces can be clamped on 3-, 4-, or 5-axis machine
- Adapter plates for MNG available

Scope of supply:
Base body without jaws

Highly anticipated – now also for round components

Machining round components has become daily routine for many companies. We now have a solution in the portfolio in the form of the SBF 3 stationary three-jaw chuck – fully compatible with the in-house MNG and PNG zero point clamping systems for rapid, uncomplicated handling.

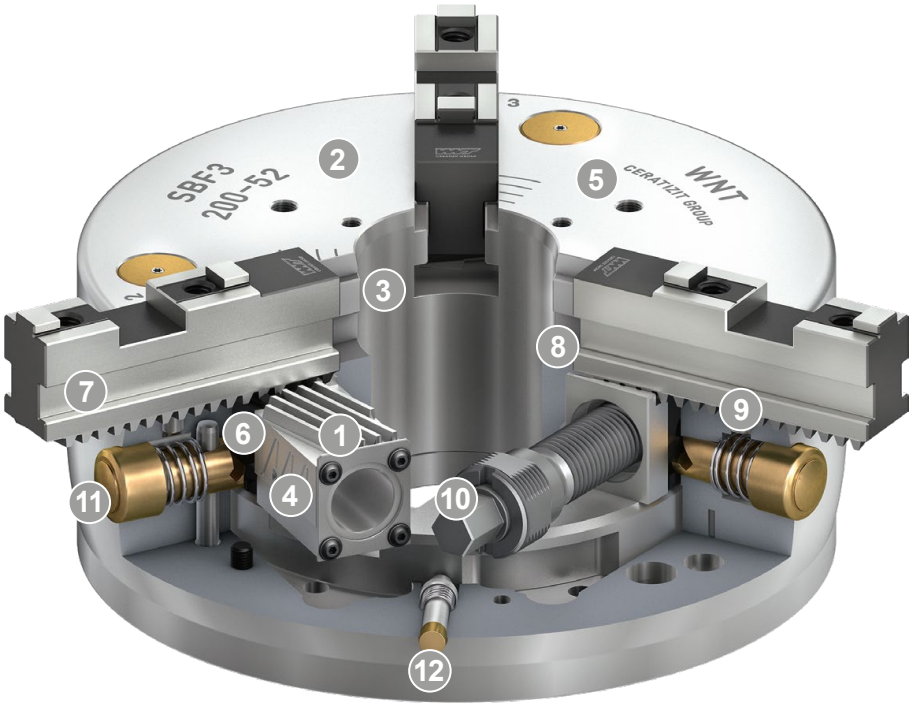
The benefits for you:

- Suitable for 5-axis machining of round components
- Compatible with PNG and MNG zero point clamping systems
- Quick change jaw system with single release of jaws
- Spindle with hex connection

SBF 3 Ø 200 mm

SBF 3 Ø 315 mm

Technical information – cross-section diagram



1 **Wedge bar drive**
Allows for excellent machining results

2 **Hardened and extremely stiff base body**
Longer tool life with maximum precision as a result - even at the highest clamping force

3 **Large through hole**
For machining all common bar material diameters (optional: enlargement of through hole)

4 **Optimized lubrication system**
For high degree of efficiency

5 **Mounting threads**
For workpiece stops or cover plates

6 **Quick jaw change system**
Single release of jaws, meaning extremely short setup times

7 **Base jaws with angled teeth (SFG)**

8 **Locking mechanism**
Guarantees secure engagement of the base jaw teeth with the wedge bar teeth

9 **Engagement pin**
For pre-positioning the base jaw

10 **Actuation via hex connection**
Easier operation as a result

11 **Pushbutton for jaw change**
For extremely short setup times

12 **Indicator pin**
For visual stroke monitoring of the manual clamping chuck

CoreLine – SBF 3 three-jaw chuck (Ø 200 mm) with console – SBF 3

- Suitable for 3/5-axis machining of round components
- Compatible with PNG and MNG zero point clamping systems (zero point clamping bolts must be ordered separately)
- Quick change jaw system with single release of jaws
- Spindle with hex connection

Scope of supply:
SBF 3 three-jaw chuck (Ø 200 mm) including console (PNG- and MNG-compatible)
1 set GBA base jaws
1 set SB-H stepped jaws
6 fixing screws and clamping key

CoreLine – Aluminum form collet – MNG

▲ MNG – mechanical zero point clamping system
▲ For incorporation of forms for 2nd side machining

Scope of supply:
Collet with positioning pins, without mounting bolt

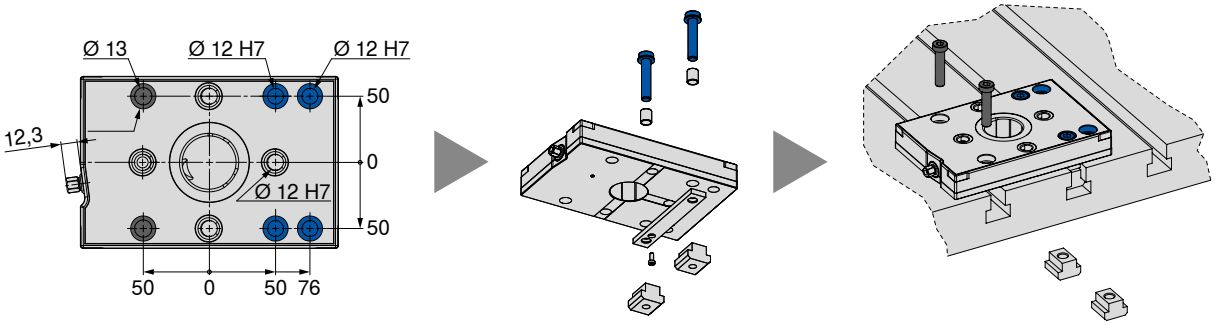
MNG clamping options

MNG – Base plate, rectangular

Mounting:

- 2 x M12 countersunk screws
- 1 x Alignment and centering set

→ Here you will find suitable screws.

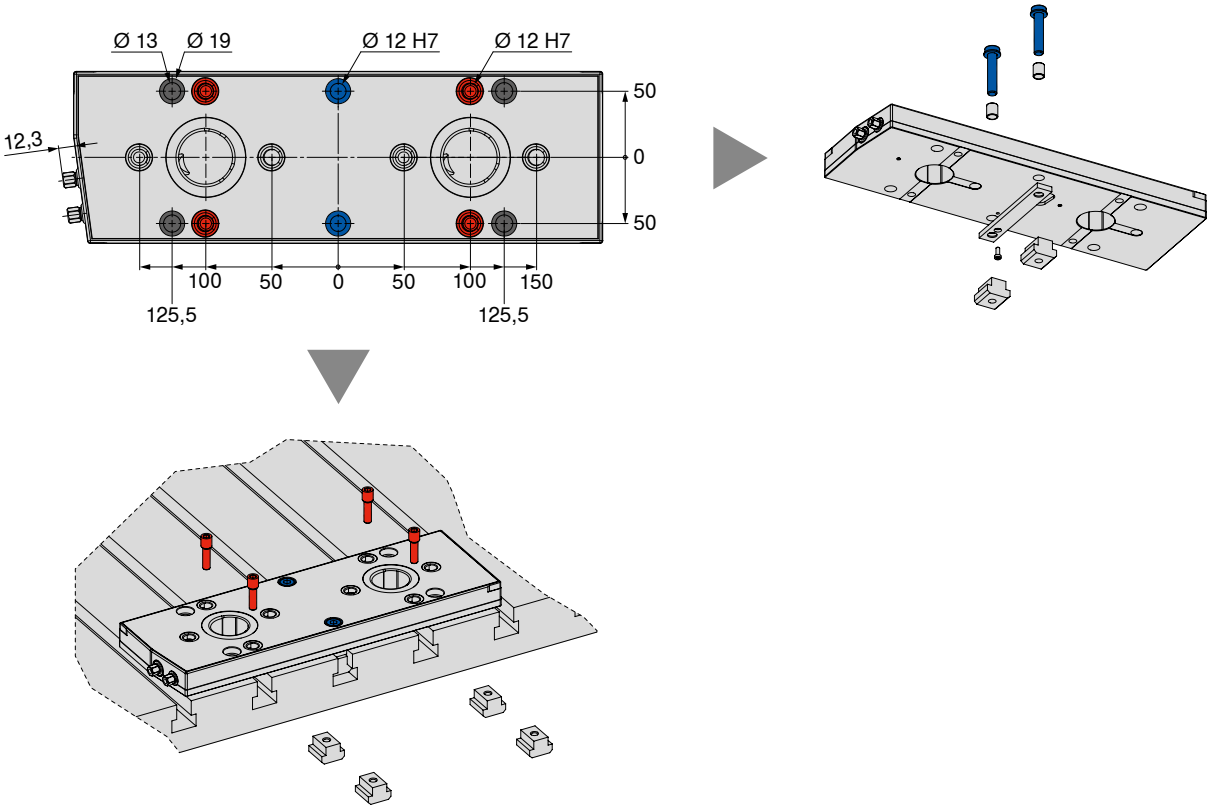


MNG – Base plate, rectangular 2-location

Mounting:

- 4 x M12 countersunk screws
- 1 x Alignment and centering set
- 4 x M8 MNG special screws

→ Here you will find suitable screws.



MNG clamping options

MNG – Base plate, rectangular 3-location

Mounting:

- 5 x M12 countersunk screws
- 1 x Alignment and centering set
- 5 x M8 MNG special screws

→ Here you will find suitable screws.

Assembly – Clamping bolts

The workpieces or devices being assembled are positioned and fixed with three different clamping bolts:

Centering bolt
Precision-ground, used to precisely position the clamping device.

Positioning bolt
This bolt, which is also known as a diamond bolt, is only ground in an axial direction so that the system is not overloaded.

Locking bolt
Ensures that the pallets lie flat on the clamping system. Ground smaller to short taper.

Clamping bolt

- PNG – pneumatic zero point clamping system
- Three bolt types – ZB (centering bolt), PB (positioning bolt), HB (clamping bolt)
- Precision location bolts ensuring accuracy and repeatability
- Clamping force 50 kN

Scope of supply:
Incl. M10 fixing screw

PNG

CoreLine – Aluminum clamping pallet

▲ Clamping pallet for mounting PNG and MNG
▲ Without hole pattern

Scope of supply:
Unmachined clamping pallet, PNG clamping bolt and positioning pin

Size	A mm	B mm	C mm	D mm	E mm	F mm	G	H mm	N	WT kg	CW 80 809 ...

Material examples

Extended Material Examples for the Cutting Data Tables

	Material sub-group	Index	Composition / Structure / Heat treatment		Tensile strength N/mm²* / HB / HRC
P	Unalloyed steel	P.1.1	< 0,15 % C	Annealed	420 N/mm² / 125 HB
		P.1.2	< 0,45 % C	Annealed	640 N/mm² / 190 HB
		P.1.3		Tempered	840 N/mm² / 250 HB
		P.1.4	< 0,75 % C	Annealed	910 N/mm² / 270 HB
		P.1.5		Tempered	1010 N/mm² / 300 HB
	Low-alloy steel	P.2.1		Annealed	610 N/mm² / 180 HB
		P.2.2		Tempered	930 N/mm² / 275 HB
		P.2.3		Tempered	1010 N/mm² / 300 HB
		P.2.4		Tempered	1200 N/mm² / 375 HB
	High-alloy steel and high-alloy tool steel	P.3.1		Annealed	680 N/mm² / 200 HB
		P.3.2		Hardened and tempered	1100 N/mm² / 300 HB
		P.3.3		Hardened and tempered	1300 N/mm² / 400 HB
	Stainless steel	P.4.1	Ferritic / martensitic	Annealed	680 N/mm² / 200 HB
		P.4.2	Martensitic	Tempered	1010 N/mm² / 300 HB
M	Stainless steel	M.1.1	Austenitic / austenitic-ferritic	Quenched	610 N/mm² / 180 HB
		M.2.1	Austenitic	Tempered	300 HB
		M.3.1	Austenitic / ferritic (Duplex)		780 N/mm² / 230 HB
K	Grey cast iron	K.1.1	Pearlitic / ferritic		350 N/mm² / 180 HB
		K.1.2	Pearlitic (martensitic)		500 N/mm² / 260 HB
	Spherulitic graphite cast iron	K.2.1	Ferritic		540 N/mm² / 160 HB
		K.2.2	Pearlitic		845 N/mm² / 250 HB
	Malleable iron	K.3.1	Ferritic		440 N/mm² / 130 HB
		K.3.2	Pearlitic		780 N/mm² / 230 HB
N	Aluminium wrought alloy	N.1.1	Non-hardenable		60 HB
		N.1.2	Hardenable	Age-hardened	340 N/mm² / 100 HB
	Cast aluminium alloy	N.2.1	≤ 12 % Si, non-hardenable		250 N/mm² / 75 HB
		N.2.2	≤ 12 % Si, hardenable	Age-hardened	300 N/mm² / 90 HB
		N.2.3	> 12 % Si, non-hardenable		440 N/mm² / 130 HB
	Copper and copper alloys (bronze/brass)	N.3.1	Free-machining alloys, PB > 1 %		375 N/mm² / 110 HB
		N.3.2	CuZn, CuSnZn		300 N/mm² / 90 HB
		N.3.3	CuSn, lead-free copper and electrolytic copper		340 N/mm² / 100 HB
	Magnesium alloys	N.4.1	Magnesium and magnesium alloys		70 HB
S	Heat-resistant alloys	S.1.1	Fe - basis	Annealed	680 N/mm² / 200 HB
		S.1.2		Age-hardened	950 N/mm² / 280 HB
		S.2.1	Ni or Co basis	Annealed	840 N/mm² / 250 HB
		S.2.2		Age-hardened	1180 N/mm² / 350 HB
		S.2.3		Cast	1080 N/mm² / 320 HB
	Titanium alloys	S.3.1	Pure titanium		400 N/mm²
		S.3.2	Alpha + beta alloys	Age-hardened	1050 N/mm² / 320 HB
		S.3.3	Beta alloys		1400 N/mm² / 410 HB
H	Hardened steel	H.1.1		Hardened and tempered	46–55 HRC
		H.1.2		Hardened and tempered	56–60 HRC
		H.1.3		Hardened and tempered	61–65 HRC
		H.1.4		Hardened and tempered	66–70 HRC
	Chilled iron	H.2.1		Cast	400 HB
	Hardened cast iron	H.3.1		Hardened and tempered	55 HRC
O	Non-metal materials	O.1.1	Plastics, duroplastic		≤ 150 N/mm²
		O.1.2	Plastics, thermoplastic		≤ 100 N/mm²
		O.2.1	Aramid fibre-reinforced		≤ 1000 N/mm²
		O.2.2	Glass/carbon-fibre reinforced		≤ 1000 N/mm²
		O.3.1	Graphite

ISO designation system

ISO attribute	Feature Description
A	
ADJRG	Adjustment range
ADJRGR	Adjustment range radial
ALP	Clearance angle axial
AN	Clearance angle major
APMX	Depth of cut maximum
B	
B	Shank width
BD	Body diameter
BD_1	Body diameter, 1st cutting step
BD_2	Body diameter, 2nd cutting step
BD_3	Body diameter, 3rd cutting step
BD_4	Body diameter, 4th cutting step
BDRED	Body diameter, reduced
BDX	Body diameter maximum
BHTA	Body half taper angle
BLQ	Balance quality code
BN	Face land width
BS	Trailing edge length
BTED	Body taper end diameter
C	
CDX	Cutting depth maximum
CF	Central flat
CHW	Corner chamfer width
CHWTL	Flank chamfer width left hand
CLDIS_1	Centre line distance 1
CLDIS_2	Centre line distance 2
CLDIS_3	Centre line distance 3
CND	Coolant entry diameter
CNT	Coolant entry, thread size
CODX	Parting off diameter, max.
CRE	Spot radius
CRKS	Pull stud thread size
CW	Cutting width
CXD	Coolant exit diameter
D	
D1	Fixing hole diameter
DAXN	Axial groove outside diameter minimum
DAXX	Axial groove outside diameter maximum
DC	Cutting diameter
DC_1	Cutting diameter, 1st cutting step
DC_2	Cutting diameter, 2nd cutting step
DCD	Cutting diameter drilling part
DCINTF	Interference cutting diameter
DCN	Cutting diameter minimum
DCONMS	Mounting spigot diameter
DCONWS	Connection diameter workpiece side
DCONWS_1	Connection diameter workpiece side – 1
DCONWS_2	Connection diameter workpiece side – 2
DCSKX	Countersunk diameter, max
DCX	Cutting diameter maximum
DF	Flange diameter
DFC	Functional diameter
DHUB	Hub diameter
DLN	Diameter lock nut
DMIN	Minimum bore diameter
DN	Neck Diameter
DRVS	Drive size

ISO attribute	Feature Description
G	
GAN	Insert rake angle
GB	Face land angle
H	
H	Shank height
HDD	Head diameter
HDW	Head width
HF	Functional height
HLN	Lock nut height
HSUP	Support height
I	
IC	Inscribed circle diameter
IDNR	Identifying order number
IH	Insert hand
INSL	Insert length
K	
KAPR	Tool cutting edge angle
KCH	Corner chamfer angle
L	
L	Cutting edge length
L_1	Cutting edge length 1
L_2	Cutting edge length 2
L_3	Cutting edge length 3
LB	Body length
LB_1	Body length 1
LB_2	Body length 2
LCF	Length chip flute
LCOL	Collet length
LDRED	Reduced body diameter length
LE	Cutting edge effective length
LF	Functional length
LF_1	Functional length 1
LF_2	Functional length 2
LF_3	Functional length 3
LFSF	Distance to face
LH	Head length
LPCON	Connection protruding length
LPR	Protruding length
LS	Shank length
LSC	Clamping length machine side
LSCN	Clamping length minimum machine side
LSCX	Clamping length maximum machine side
LTA	Length tool assembly
LU	Usable length
M	
MXC	Clamping force maximum
N	
NOF	Flute count
NT	Tooth count
O	
OAH	Overall height
OAL	Overall length
OAW	Overall width

ISO designation system

ISO attribute	Feature Description
P	
PDPT	Profile depth insert
PDX	Profile distance ex
PDY	Profile distance ey
PHD	Premachined hole diameter
PL	Point length
PLGL	Plug length
PNA	Profile included angle
PRFA	Profile angle
PRFRAD	Profile radius
PRFRAD1	Profile radius 1
PRFRAD2	Profile radius 2
PRFRAD3	Profile radius 3
PSIR	Tool lead angle
R	
RA	Relief angle
RADH	Radial height
RADW	Radial width
RADWOF	Radial offset width
RAL	Relief angle lh
RAR	Relief angle rh
RCSK	Radius countersunk
RE	Corner radius
RE_1	Corner radius 1
RE_2	Corner radius 2
RE_3	Corner radius 3
REL	Corner radius left hand
RETL	Flank radius left hand
RETR	Flank radius right hand
RHCDL	Radial height chamfer distance lower
RHCDU	Radial height chamfer distance upper
RPMX	Rotational speed maximum
S	
S	Insert thickness
S1	Insert thickness total
SD	Step distance
SDL	Step diameter length
SDL_1	Step diameter length 1
SDL_2	Step diameter length 2
SZID	Nominal size
T	
TD	Thread diameter
TDIN	Thread diameter, inch measure
THID	Thread designation inside
THL	Thread cutting part length
THOD	Thread designation outside
THSZMS	Connection thread nominal size
THSZWS	Connection thread nominal size workpiece side
TP	Thread pitch
TPI	Threads per inch
TQX	Torque maximum

ISO attribute	Feature Description
W	
W1	Insert width
WF	Functional width
WF2	Functional width 2
WT	Weight of item
Z	
ZEFF	Face effective cutting edge count
ZEFP	Peripheral effective cutting edge count
ZNF	Face mounted insert count
ZNP	Peripheral mounted insert count

We reserve the right to make technical changes and product improvements.
