Dirección de mecanizado

Consejos

- ① 

▲ Filos de corte muy vivos para prevenir la delaminación en piezas de fibra de vidrio y fibra de carbono.

- ② 

▲ Para lograr una larga vida útil en el mecanizado de RFA, RFC y grafito.

- ③ 

▲ Especial para el mecanizado de materiales de panal de abeja; fresado de cajas no pasantes.

- ④ 

▲ Especial para el mecanizado de materiales de panal de abeja.

- ⑤ 

▲ Fresado de ranuras pasantes, los fillos de corte de tracción mecanizan y estabilizan el material de cubierta superior, mientras que los fillos de corte de presión lo hacen con el inferior.

- ⑥ 

▲ Para el mecanizado de plásticos no reforzados con fibras y metales no ferrosos con un bajo contenido de Si (PE, PA, PVC, vidrio acrílico).

- ⑦ 

- ⑧ 

▲ Para el mecanizado de plásticos reforzados con fibras y metales no ferrosos con un alto contenido de Si.

- ⑨

 Ángulo de inmersión para fresado en rampa = 1,9°
 Ángulo de inmersión para fresado helicoidal = 1,5°
 Diámetro del agujero en el fresado helicoidal = $D_{\text{mín.}} \cdot 1,7 \times DC / D_{\text{máx.}} \cdot 1,95 \times DC$
 En el fresado en rampa y en el fresado helicoidal hay que multiplicar f_z por 0,5

Fresado trocoidal

Gracias al fresado trocoidal, también son posibles grandes profundidades de corte con máquinas inestables y débiles.

Dependiendo de la resistencia del material, la carga radial puede ser del 5-20 % del diámetro de corte de la fresa. Dado que el fresado trocoidal implica bajas cargas laterales, las fuerzas que se producen son menores.

Al fresar una ranura trocoidalmente, el diámetro de la fresa debe ser como máximo el 70 % del ancho de la ranura.

Ejemplo: Ranura 20 mm x 70 % = 14 mm

Una fresa de \varnothing 14 mm sería la herramienta perfecta.

Ventajas/Beneficios

- ▲ Desgaste de la herramienta más reducido
- ▲ Reducción del tiempo de mecanizado
- ▲ Aprovechamiento pleno de los filos de corte
- ▲ Reducción de las fuerzas de corte

La mayoría de los proveedores de CAM proporcionan una aplicación para el fresado trocoidal. Nuestras recomendaciones para esta aplicación son las siguientes:

Indicaciones técnicas

Ajuste de la velocidad de avance

Si la velocidad de corte de las tablas no puede ser alcanzada por el husillo de la máquina, el avance debe reducirse en la misma proporción.

Ejemplo:

Según las tablas $n = 50.000$ r.p.m. y $v_f 1.000$ mm/min.,
Velocidad máx. de máquina = 40.000 r.p.m.

Calculamos el avance a introducir:
 $(40.000 \text{ r.p.m.} / 50.000 \text{ r.p.m.}) * 100 \% = 80 \%$
 $1000 \text{ mm/min} * 80 \% = 800 \text{ mm/min}$

Avance a introducir = **800 mm/min.**

Inmersión en rampa con fresas de metal duro integral

La inmersión en rampa con fresas frontales de metal duro integral es posible con un ángulo de 2° a 10° , dependiendo de la versión. Un chaflán protector de filo o el radio de punta son ventajosos.

Ángulos de inmersión recomendados para las fresas de metal duro:

- ▲ Fresas de hasta 3 dientes - ángulo de inmersión → $6^\circ - 10^\circ$
- ▲ Fresas de 4 dientes - ángulo de inmersión → $3^\circ - 6^\circ$
- ▲ Fresas de 5 dientes - ángulo de inmersión → $2^\circ - 3^\circ$
- ▲ Fresas con más de 5 dientes → Posible solo condicionalmente

Preparación para la fresa de ranuras en T

Para producir una ranura en T con la fresa de MDI para ranuras en T, proceda de la siguiente manera

1

Fresar previamente la ranura a unos $0,5$ mm por encima del fondo.
El fondo corresponde a la dimensión acabada de la ranura en T.
En este paso se debe trabajar el ancho de la ranura hasta la dimensión final.

2

A continuación, termine de fresar la ranura con la fresa de ranuras en T.
Al entrar en el material, reduzca el avance en un 50% .

Comparación – Fresa de punta esférica vs. 3D Finish

3D Finish

- ▲ Radio independiente del diámetro de la herramienta
- ▲ Mayor paso gracias al gran radio
- ▲ Herramientas con radio grande y diámetro de mango pequeño son más convenientes, ya que el contenido de metal duro es menor, p.e. Ø 16 mm radio 1500 mm

Fresa de punta esférica

- ▲ El radio depende del diámetro de la herramienta
- ▲ Pasos pequeños vinculados a los radios pequeños
- ▲ Las herramientas de diámetro / radio grandes son costosas debido a la cantidad de metal duro que contienen, p.e. Ø 16 mm R8 mm

Fórmulas para el cálculo:

$$b_r = 2 \times \sqrt{R_{th} \times (r \times 2 - R_{th})}$$

$$R_{th} = r - \sqrt{\frac{(r \times 2)^2 - b_r^2}{4}}$$

$$R_a \approx 0,1 \times R_{th}$$

$$R_{th} \approx R_a / 0,1$$

Resultado

Calidad superficial requerida = R_a 0,4

$R_{th} \approx 0,4 / 0,1 \approx 4 \mu\text{m} = 0,004 \text{ mm}$

Fresa de punta esférica

Diámetro 16 mm, Radio 8 mm

$$b_r = 2 \times \sqrt{0,004 \times (8 \times 2 - 0,004)}$$

$b_r = 0,51 \text{ mm}$

3D Finish

Diámetro 16 mm, Radio 1500 mm

$$b_r = 2 \times \sqrt{0,004 \times (1500 \times 2 - 0,004)}$$

$b_r = 6,93 \text{ mm}$

Ayuda para el cálculo del fresado de copia

Rugosidad superficial teórica (R_{th}) y paso (b_r)

$$R_{th} = r - \sqrt{\frac{(r \times 2)^2 - b_r^2}{4}}$$

$$b_r = 2 \times \sqrt{R_{th} \times (r \times 2 - R_{th})}$$

$$R_{th} \approx R_a / 0,1$$

$$R_a \approx 0,1 \times R_{th}$$

Para lograr una superficie limpia con el fresado de copia, se debe adaptar el paso b_r al diámetro de la fresa DC. Mientras menor sea el diámetro de la fresa DC, menor debe ser el paso b_r .

Factor de corrección del número de revoluciones ($K_f n$) para el fresado de copia

$$n = \frac{v_c \times 1000}{DC \times \pi} \times K_f n$$

Ayuda para el cálculo del fresado de copia

En fresados de contorneado o de copiado, con fresas de punta esférica y con profundidades de corte de $a_p \geq 0,5 \times DC$ y $a_e = 0,2$ hasta $0,5 \times DC$, el número de revoluciones se debe calcular con la siguiente fórmula:

$$n = \frac{v_c \times 1000}{DC \times \pi}$$

En fresados con fresas de punta esférica, el diámetro efectivo de la fresa d_{eff} debe calcularse con la siguiente fórmula:

Fresas de punta esférica

Fresa toroidal

$$d_{\text{eff}} = 2 \times \sqrt{a_p \times (DC - a_p)}$$

$$d_{\text{eff}} = DC \times \sin\left(\beta \pm \arccos\left(\frac{DC - 2a_p}{DC}\right)\right)$$

$$d_{\text{eff}} = (DC - 2RE) + 2 \times \sqrt{a_p \times (2RE - a_p)}$$

Indicaciones relativas al fresado descendente o ascendente

- ① Al mecanizar perfiles descendentes, es posible alcanzar velocidades de avance relativamente altas ya que la profundidad de corte es relativamente baja (área destacada en azul).
- ② Gran aumento de la profundidad de corte al alcanzar la base del perfil, mediante un mayor ancho de corte de la fresa. Es imprescindible reducir la velocidad de avance, de otro modo las vibraciones o la desalineación pueden provocar la rotura de la herramienta. La magnitud en que debe corregirse la velocidad de avance depende del ángulo de copiado y de la profundidad de corte axial.
- ③ La velocidad de avance puede volver a aumentarse tan pronto disminuya la profundidad de corte a_p , de la base del perfil.

Regla:

Cuanto más pronunciado es el ángulo, menor es la velocidad de avance. Cuanto más superficial es el ángulo, mayor es la velocidad de avance.

Durante el fresado de superficies descendentes o ascendentes, la velocidad de avance se debe adaptar a las diferentes posiciones de fresado. De lo contrario, se podría dañar el filo de corte debido a la sobrecarga (vibraciones o desalineación).
